Characteristics of Workers in Large States and SMSA's–1970

REPORT 388

U.S. DEPARTMENT OF LABOR
Bureau of Labor Statistics

This report is the latest in a series of articles presenting geographic labor force data from the Current Population Survey. It provides 1970 data on an annual average basis. The earlier publications, "Jobless Trends in 20 Large Metropolitan Areas" (Monthly Labor Review, May 1968), "Unemployment by Region and in Largest States" (Monthly Labor Review, January 1970), and "Geographic Aspects of Unemployment in 1969" (Employment and Earnings, April 1970), together presented information on area labor force statistics from 1967 to 1969. The purpose of this report is to provide detailed 1970 information on the demographic composition of the areas' labor force not presently available from other sources.

This report was prepared in the Bureau's Office of Manpower and Employment Statistics by Paul M. Schwab, under the supervision of Howard V. Stambler. Nicholas I. Peters and Christopher G. Gellner provided assistance in the preparation of the report.

1971

Characteristics of Workers in Large States and SMSA's, 1970

An analysis of the 1970 area data from the Current Population Survey shows that the demographic characteristics of employment and the labor force vary significantly among the Nation's 10 largest States and 20 largest metropolitan areas. Key interarea differences were found also in labor force characteristics such as participation rates, full- and part-time status of workers, and unemployment.[1]

10 largest States

The latest area findings reflect the fact that the number and proportion of Negroes[2] in the labor force vary widely among the 10 largest States. The State of New York had the largest Negro civilian labor force, at 820,000; however, Negroes accounted for 11 percent of the States' labor force, the same as the national average. Among the remaining large States studied, the proportion of Negroes in the labor force ranged from 15 percent (Florida) to 3 percent (Massachusetts).

The age-sex composition of the labor force in the 10 States varies somewhat less than the color composition. The proportion of adult men in the labor force ranged from 59 percent in Pennsylvania and New Jersey to 55 percent in Massachusetts; for adult women, the proportion ranged from 36 percent in Florida and Massachusetts to 32 percent in Michigan; the proportion of teenagers in the labor force ranged from a high of 11 percent in Michigan to a low of 7 percent in New York.

The labor force participation rates of most of the 10 States were clustered closely around the national average of 60.4 percent. One notable exception was Florida (55 percent), where substantially lower-than-national rates were recorded for adult white men.

New data on full- and part-time status of these 10 States' labor force show that, although little inter-State differences existed in the proportion of all workers on full-time schedules, considerable variation occurred among the proportion of Negroes so employed. For the Nation as a whole, 81.4 percent of all employed Negroes were on full-time schedules in 1970; Florida and Texas were the only States among the 10 largest where such proportions (73 and 77 percent, respectively) were lower than the national average. The proportion in the remaining eight States ranged narrowly from 84 to 89 percent. Conversely, the proportion of Negroes employed part time for economic reasons (such as slack work or inability to find a full-time job) exceeded the national average of 5.8 percent only in Texas and Florida (7 and 9 percent, respectively).

Unemployment rates among these 10 States in 1970 ranged from 3.6 percent in Illinois to 7.2 percent in California. The pattern of Negro-white jobless rate ratios extended from about 1.5 to 1 up to 3.0 to 1; 6 of the 10 States were at the national ratio of 1.8 to 1.

Metropolitan areas

The composition of the labor force in the Nation's largest metropolitan areas and their

[1] Annual averages for the 10 States and 20 metropolitan areas have been adjusted to independent population estimates made by the Bureau of the Census and are based largely on preliminary data from the 1970 Decennial Census.

Annual averages for 1968 and 1969 for the same States and areas published in earlier BLS releases were adjusted to independent population estimates derived from projections based on the 1960 Decennial Census. Discontinuities exist between these two independent sets of population estimates which carry over into the comparisions of 1970 data with data for 1968 and 1969 on labor force, employment, and unemployment levels. As a consequence, no evaluation should be made of year-to-year trends in the estimates of levels. Ratios, rates, and percentages, on the other hand, are not affected to any extent by discontinuities in the population estimates, so they may be compared with estimates for earlier years. An analysis currently is underway to determine the effects of the changes in population estimates on these data.

[2] Throughout this report, "Negro" is used to denote the "Negro and other races" category.

portion of Negroes in the labor force of the 20 largest Standard Metropolitan Statistical Areas (SMSA's) ranged from 25 percent in Baltimore and Washington to 5 percent in Minneapolis—St. Paul. In the Washington and Baltimore central cities, Negroes accounted for 67 percent and 50 percent of the labor force, respectively. As for the age-sex composition of the SMSA labor force, the proportion of central cities also varied substantially from the corresponding national averages. The pro-adult men ranged from 54 percent (Boston and Washington, D.C.) to 61 percent (Pittsburgh). Adult women made up only 30 percent of the labor force in Pittsburgh, but 38 percent in Washington, D.C. The teenage labor force ranged from 6 percent of the total in New York to 12 percent in Minneapolis—St. Paul.

Labor force participation among the largest metropolitan areas ranged from a high of 71 percent in Dallas to a low of 54 percent in Pittsburgh. For the six largest SMSA's (New York, Los Angeles—Long Beach, Chicago, Philadelphia, Detroit, and San Francisco—Oakland), the participation rate for adult men clustered narrowly around the national average; inter-SMSA differences in participation rates were greatest among adult females and teenagers.

The proportion of workers employed on full-time schedules was higher than the U.S. average in 12 of the 20 SMSA's. The proportion was lowest in Minneapolis—St. Paul (79 percent) and highest in New York, Newark, Houston, and Dallas (87 percent). The proportion of Negro workers so employed ranged from 80 percent in Dallas to 90 percent in Chicago. With the exception of the Los Angeles—Long Beach central city, the proportion of full-time workers in the six largest central cities was somewhat higher than their respective SMSA averages.

The percent of the labor force employed part time for economic reasons in the largest metropolitan areas was generally below the national average of 3.0 percent: This proportion ranged from only 1 percent in Boston to 3 percent in San Francisco and Pittsburgh. Similarly, the proportion of the Negro labor force on part time for economic reasons also generally fell below the national average of 5.8 percent; it extended from 1.6 percent in Washington, D.C. to 6.0 percent in St. Louis.

Unemployment rates in 1970 were above the national average in half of the 20 SMSA's. Jobless rates were lowest in Washington, D.C. and Chicago (around 3.5 percent) and highest in Detroit and Los Angeles (around 7 percent). Among central cities, unemployment rates varied from around 4 percent in Washington, D.C., Chicago, Houston, and Dallas to 8 percent and above in Los Angeles, Detroit, and Cleveland. The distribution of Negro-white jobless rate ratios in the SMSA's ranged widely around the U.S. average, from 1.2 to 1 (New York and San Francisco—Oakland) to 4.0 to 1 (Cleveland).

Technical Note

The information presented in this report provides basic labor force data by age, sex, and color for the Nation's 10 largest States, 20 largest Standard Metropolitan Statistical Area (SMSA's), and for selected central cities. All of these data have been collected for the Bureau of Labor Statistics by the Bureau of the Census as part of the Current Population Survey (CPS), the same household survey used to generate the official national estimates of employment and unemployment.[1] The main purpose for their publication is to provide information on the age, sex, and color composition of these areas' labor force not available from other sources.

Definitions. The States and SMSA's for which data are presented in this report are the largest in terms of their 1960 population. Preliminary 1970 census estimates indicate that Cincinnati, Paterson—Clifton—Passaic, and Buffalo are no longer among the Nation's 20 largest metropolitan areas. Data for Anaheim—Santa Ana, Seattle—Everett, and Atlanta, the three additions to the list, currently are not tabulated from the CPS.

For purposes of this report, the boundaries of the 20 SMSA's, which may encompass one or more large cities and the adjacent suburban counties, are those which were in effect in 1960. The central cities include the corporate limits of the city or cities named in the SMSA title.

Statistical reliability. The statistical variability of the area estimates is much larger than that for national data derived from the CPS. As a result, any area-to-area comparisons of labor force characteristics should be made with caution.

Standard error tables for State figures are presented in tables A-G for use in calculating reliability estimates of these data. Chances are about 68 out of 100 that State sample estimates would differ by less than their respective standard errors from labor force figures which would have been obtained from a complete census. For a higher level of statistical reliability (i.e., 90 changes out of 100), standard error figures should be multiplied by 1.6.

Sampling errors for most metropolitan data presented in this report have not yet been calculated; nevertheless, these estimates do not have a statistical reliability comparable to national averages.[2] Labor force information by detailed age-sex-color groups have not been published for all individual areas because of the extreme variability of the data.

Annual averages for the 10 States and 20 metropolitan areas have been adjusted to independent population estimates made by the Bureau of the Census; these estimates are based largely on preliminary data from the 1970 Decennial Census. State and local area data from the CPS for 1968 and 1969, on the other hand, were adjusted to independent population estimates derived from projections based on the 1960 Decennial Census. Consequently, no evaluation should be made at this time of year-to-year changes in levels, because of the use of different independent population estimates. An analysis is currently underway to determine the extent of any discontinuity in the series. Information on the progress of this analysis can be obtained from the Office of Manpower and Employment Statistics, Bureau of Labor Statistics.

Comparability with Manpower Administration work force and unemployment statistics. The Manpower Administration (MA) and its affiliated State employment security agencies also publish work force and unemployment levels and rates for States and SMSA's. In some instances, data

[1] Data from the Current Population Survey are completely independent of data from the 1970 Decennial Census. As such, 1970 area labor force estimates presented in this report may differ from area data to be published from the Decennial Census.

[2] Work is being undertaken now to provide detailed standard error tables for individual SMSA's and central cities, comparable to those provided in this report for States.

(5)

presented in the BLS report may vary from figures published as part of the MA program. Variations occur because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. Following are the basic differences in methods, coverage, and definition between BLS and MA estimates:

(1) The MA figures are estimated by State employment security agencies which use insured unemployment as a base for the unemployment estimate and then apply standardized methods to calculate the unemployment not included in these counts. The latter include persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons who have lost jobs not covered by unemployment insurance systems, such as workers in agriculture, State and local government, domestic service, self-employment, unpaid family work, nonprofit organizations, and firms below a minimum size.[3] The BLS estimates come from a sample survey of the households in the population. Although the concepts of unemployment used are the same, with minor exceptions, the two methods of estimation do result in some differences.

(2) The MA estimates of employment are based on employer payroll records and, therefore, involve some double-counting of multiple job holders. Payroll figures count each job, whereas the household survey counts each person once only. Also, problems of place of work versus place of residence arise. Although both the MA and BLS unemployment estimates are based on where people live, the MA employment estimates are based on where people work, while the BLS estimates count employed persons where they live.

(3) The SMSA boundaries used in the BLS study are those that were in effect in 1960; the MA has updated SMSA definitions for boundary changes made through 1970. Eleven of the 20 largest SMSA's were redefined between 1960 and 1970; they are Baltimore, Boston, Cincinnati, Cleveland, Dallas, Houston, Los Angeles—Long Beach, Milwaukee, St. Louis, San Francisco—Oakland, and Washington.

(4) The MA unemployment definitions have not yet been adjusted for the changes in definition and coverage that were introduced by the BLS in January 1967.[4]

These differences in methods, definitions, and coverage contribute to the variances in labor force (or work force), unemployment, and unemployment rates in the States and SMSA's covered by both BLS and MA.

[1] See footnote 1, p. 1, and technical note.

[2] In 90 cases out of 100, the unemployment level from a complete census would fall within a range which had the limites of plus or minus the level shown.

[3] In 90 cases out of 100, on the average, the unemployment rate from a complete census would fall within the indicated ranges.

[4] Not shown where level of civilian labor force is less than 50,000.

NOTE: Individual items may not add to totals due to rounding.

[1] See footnote 1, p. 1, and technical note.

[2] In 90 cases out of 100, on the average, the unemployment level from a complete census would fall within a range which has the limits of plus or minus the level shown.

[3] In 90 cases out of 100, on the average, the unemployment rate from a complete census would fall within the indicated ranges.

[4] Not shown separately where civilian labor force estimate is less than 50,000.

[5] Not shown separately where unemployment estimate is less than 5,000.

NOTE: Individual items may not add to totals due to rounding.

EMPLOYMENT AND EARNINGS

STATES AND AREAS 1939-69

A COMPREHENSIVE AND ESSENTIAL REFERENCE VOLUME

Employment, hours, earnings, graphic analysis, and special summaries, BLS Bulletin 1370-7, $4.50 per copy (614 pages)

Features for all states and 214 major areas nearly 8,000 series on payroll employment by industry and over 3,300 series on hours and earnings of production workers by industry . . . all data from earliest date of availability . . . annual averages adjusted to latest available benchmarks.

Provides background information for community and plant location planning, labor cost analysis, economic forecasting, market research, economic and social studies, and personnel management for use by labor unions, business firms, trade associations, research workers in many fields, libraries and career counselors.

Send order form to any of the regional offices listed below, or to the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402.

Geographic Profile of Employment and Unemployment, 1971

Report 402

U.S. DEPARTMENT OF LABOR
Bureau of Labor Statistics

This report is the latest in a series of articles presenting geographic labor force data from the Current Population Survey (CPS). It provides 1971 annual average data for regions, large States, and large metropolitan areas. Data for previous years (1967-1970) may be found in the following articles and reports: "Jobless Trends in 20 Large Metropolitan Areas" (*Monthly Labor Review*, May 1968), "Unemployment in 20 Large Urban Areas" (*Employment and Earnings*, March 1969), "Unemployment by Region and in Largest States" (*Monthly Labor Review*, January 1970), "Geographic Aspects of Unemployment in 1969" (*Employment and Earnings*, April 1970), "Characteristics of Workers in Large States and SMSA's-1970" (*BLS Report 388*, April 1971), and "Regional Aspects of Unemployment, 1969-70" (*BLS Report 395*, October 1971). Selected area data from the CPS also are published annually in the Statistical Appendix to the *Manpower Report of the President*.

This report was prepared in the Bureau's Office of Current Employment Analysis by Paul M. Schwab under the direction of Paul O. Flaim. Nicholas I. Peters provided technical assistance in the preparation of the tables.

1972

Geographic Profile of Employment and Unemployment, 1971

Generally, the incidence of unemployment in the Nation has been distributed unevenly not only among various labor force groups but also geographically. The geographic imbalances reflect, in large part, inter-area differences in factors such as age-sex-color composition of the labor force, the industrial and occupational mix, and the growth characteristics of respective sections of the country. In addition to these longstanding "structural" factors, the economic events of the last few years have had a major effect on the current geographic pattern of unemployment. For example, the Pacific Coast and New England have been particularly hard hit by unemployment, as defense and aerospace-related activities, industries heavily concentrated in these areas, underwent sharp cutbacks.

This BLS report provides 1971 statistics on the demographic composition of unemployment and other labor force characteristics by geographic areas, data which are not generally available from other sources. It is the latest in a series presenting such data from the Current Population Survey (CPS) and covers the Nation's four regions and nine census divisions, 10 largest States, 20 large metropolitan areas, and 14 of their central cities. Following are selected highlights from the Bureau of Labor Statistics examination of these data for 1971.

Regions

Unemployment in 1971 continued to be distributed unevenly across the Nation's regions. The jobless rate in the West, at 8.1 percent, was substantially higher than the national average of 5.9 percent. Unemployment rates in the Northeast and North Central regions, at 6.2 and 5.5 percent, respectively, hovered more closely around the overall rate, and the incidence of joblessness in the South, 4.9 percent, was the lowest in the Nation. The unemployment situation in the Southern States partly reflected the fact that, compared with most other areas, this region was somewhat less affected by the economic repercussions of the recent recession. Employment cutbacks during the downturn were concentrated particularly in some durable-goods manufacturing industries that are not prominent in the South.

The unemployment rate for Negroes[1] in 1971 ranged from 8.8 percent in the South to 12.8 percent in the North Central States. Despite the lower-than-national Negro rate in the South, however, the proportion of Negroes employed part-time for economic reasons—such as slack work or inability to find a full-time job—continued to be far higher in the region (8.4 percent) than in the remainder of the country (4.3 percent). Moreover, the proportion of all Negro workers on full-time schedules was lower in the South than elsewhere in the Nation. The main reason was that Southern Negroes continued to be employed more numerously as low-skill laborers in farming and other fields where full-time work is often unavailable.

The overall labor force participation rates of the Nation's regions and most of their subdivisions clustered closely around the national average of 60.2 percent. Among Negroes and members of other minority races, those residing in the West, specifically in the Pacific States, generally were more likely to be in the job market than their counterparts living in other regions. This situation is partly a reflection of the relatively high labor force participation among Orientals, a group that in the Pacific Coast accounts for a substantial proportion of the persons in the "Negro and other races" category.

10 largest states

The uneveness of the national unemployment situation also was indicated in the labor force estimates for the 10 largest States. In 1971, these States together accounted for 60 percent of total U.S. unemployment, a proportion somewhat above their share of the Nation's total civilian labor force, 55 percent. This slight imbalance applied equally to whites and

[1] Throughout this report, "Negro" is used to denote the "Negro and other races" category.

(3)

Negroes residing in the States combined. The uneven pattern was even more pronounced among individual States, as evidenced by overall unemployment rates, which ranged from around 5 percent in Florida, Texas, and Illinois to a high of 8.8 percent in California.

The incidence of joblessness among Negroes tended to be highest in the three North Central States—Ohio, Michigan, and Illinois—and in California and Massachusetts. The lowest Negro unemployment rates for the year were registered in New York and Florida. In Florida, however, a sizeable proportion of Negroes were working part time for economic reasons. In at least half of the States, the Negro-white jobless rate differential varied significantly from the national 1.8-to-1 ratio; the ratios ranged from 1.2-to-1 in New York to 2.7-to-1 in Ohio.

Labor force participation rates for individual States generally flucuated closely about the national average. The overall participation rate for persons residing in Florida, however, continued to be significantly below the national mark, largely reflecting the State's status as one of the Nation's "retirement havens."

Metropolitan areas

In 1971, about 28 million workers, or one-third of the Nation's civilian labor force, resided in the 20 Standard Metropolitan Statistical Areas (SMSA's) examined in this report.[2] The overall unemployment rate for these areas combined, at 6.4 percent, was somewhat higher than the national average, a direct reflection of the higher incidence of joblessness in their central cities. Unemployment rates for individual SMSA's varied widely—from 2.7 percent in Washington, D.C. to around 9 percent in Los Angeles–Long Beach and San Francisco–Oakland.

Although the large urban areas accounted for a greater share of Negro unemployment in the Nation than of white unemployment, the difference was roughly in line with the 20 areas' share of the Nation's Negro and white labor forces. Negro jobless rates among the individual metropolitan areas varied widely around the 9.9 percent average for the 20 SMSA's combined and the country overall, ranging from a low of 3.8 percent in Washington, D.C. to a high of 16.1 percent in Cleveland.

The labor force participation rate for all persons 16 years old and over residing in the metropolitan areas was 60.4 percent in 1971, about the same as the national average. Differences in labor force participation among the individual SMSA's varied markedly—from 54 percent in Pittsburgh to 67½ percent in Dallas and Houston—and continued to reflect variations in local employment situations, as well as factors such as the age and racial composition of the population in these areas.

Within the 20 SMSA's combined, the average jobless rate in 1971 was significantly higher in the central cities (7.2 percent) than in the suburban rings (5.8 percent). The jobless rate for central city Negroes (9.8 percent) was not statistically different from that of Negroes living in the suburbs; however, nearly two-fifths of the Nation's Negro labor force resided in these 20 cities, whereas less than one-tenth lived in the suburbs. The variation in labor force proportions was a significant factor in the difference between central city and suburban unemployment rates.

Overall jobless rates among individual central cities ranged from 5.5 percent and under in Washington, Dallas, Houston, and Chicago to 10 percent and over in Cleveland, San Francisco–Oakland, Los Angeles–Long Beach, and Detroit. The incidence of unemployment among Negroes in these cities also varied substantially.

2 The boundaries of the metropolitan areas identified in this report are those which were in effect in 1960. For additional explanation, see the Technical Note that follows.

Technical Note

The information presented in this report provides basic labor force data by age, sex, and color for the following geographic areas: The Nation's four major census regions and the nine census divisions, the 10 largest States, 20 of the largest Standard Metropolitan Statistical areas (SMSA's), and 14 of their central cities. All of these data relate to persons 16 years old and over. They have been collected for the Bureau of Labor Statistics by the Bureau of the Census as part of the Current Population Survey (CPS), the same household survey used to generate the official national estimates of employment and unemployment. The main purpose for their publication is to provide information on the age, sex, and color composition of these areas' labor force not regularly available from other sources. Furthermore, the CPS area statistics are not directly comparable with employment or unemployment estimates available from the Decennial Census or as prepared by the Manpower Administration and its affiliated State employment security agencies.

Definitions. The regional breakdown used in this report is that which has long been used by the Bureau of the Census and utilized in recent BLS publications of regional data derived from the CPS.[1] Under this classification scheme, the 50 States and Washington, D.C. are grouped into four major regions—Northeast, North Central, South, and West. Each of these regions is, in turn, subdivided into two or more divisions.

The States and SMSA's for which data are presented in this report are the largest in terms of their 1960 population. Also, as used in this report, the boundaries of the 20 SMSA's are those which were in effect in 1960.[2] SMSA boundaries may encompass one or more large cities as well as adjacent suburban counties. The central cities include the corporate limits of the city or cities named in the SMSA title. Central city data are not shown separately where the 1971 civilian labor force estimate was below 240,000. The "suburbs" referred to in the report are those parts of the SMSA's which lie outside the central cities.

Independent population estimates. The 1971 findings from the CPS for the 10 States and 20 metropolitan areas have been applied to independent population estimates made by the Bureau of the Census; these estimates are derived largely from projections based on the 1970 Decennial Census. State and local area data from the CPS for 1970, as published in BLS Report 388, also were adjusted on the basis of data derived from the 1970 Census.

Published State and local area data from the CPS for 1968 and 1969, in contrast, were adjusted to independent population estimates derived from projections based on the 1960 Decennial Census. In order to eliminate any discontinuities which might have resulted from the application of 1970 Census data, the Bureau of the Census has recently provided BLS with data permitting a readjustment of 1969 and 1968 annual average estimates. In the evaluation of any changes in State and local estimates since 1968, the revised 1968 and 1969 figures should be used. These can be obtained from the Office of Current Employment Analysis, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C., 20210.

Unlike State and local estimates, regional data from the CPS have not been adjusted to independent population estimates derived from the Decennial Census.

Statistical reliability. The statistical variability of the regional estimates derived from the CPS closely approximates that of national data. For this reason, standard error tables for national figures are presented for use in calculating reliability estimates for the regional data. (See tables A and B.) Chances are about

[1] A new classification scheme—that of 10 Standard Federal Administrative Regions—recently was established to create uniform boundaries and regional office locations for Federal agencies as a means of rationalizing the organization of service delivery systems and to help assure that they are closely coordinated. Exploratory work is being undertaken now to provide labor force data from the CPS in accordance with these new regional delineations. Upon their availability, BLS will publish these data and explain the relationship between the new figures and the existing series.

[2] For a listing of the definitional changes since 1960 in the 20 largest SMSA's—by county—see Christopher G. Gellner, "Occupational Characteristics of Urban Workers," *Monthly Labor Review*, October 1971, page 30, reprinted as Special Labor Force Report 138.

(5)

68 out of 100 that regional sample estimates would differ by less than their respective standard errors from labor force figures which would have been obtained from a complete census. For a higher level of statistical reliability (i.e., 90 chances out of 100), standard error figures should be multiplied by 1.6.

The CPS estimates for States and metropolitan areas presented in this report have a much larger statistical variance than national or regional data, even when averaged over a full year. Standard errors for use in calculating the reliability of these data are presented in tables C-K. The error ranges in tables 3 and 6 have been calculated on the basis of 1.6 times the standard error.

Labor force information by detailed age-sex-color groups have not been published for all individual areas because of the extreme variability of the data. Specifically, data are not shown where the civilian labor force level estimate is less than 50,000 or the unemployment level estimate is below 5,000. Nevertheless, all area-to-area comparisons of labor force characteristics should be made with caution, utilizing the generalized standard error tables presented in tables A-K.

Comparability with labor force statistics from the 1970 Decennial Census. Except for the population adjustment process discussed in a preceding section, the area data from the CPS are completely independent of data from the 1970 Decennial Census. As such, 1970 area labor force estimates from the CPS, as published in BLS Reports 388 and 395, may differ significantly from area data to be published from the Decennial Census. Exploratory work is being undertaken now, however, to examine the relationship of area data from these two sources. Information on the progress of this analysis can be obtained by writing to the Office of Current Employment Analysis, Bureau of Labor Statistics.

Comparability with Manpower Administration work force and unemployment statistics. The Manpower Administration (MA) and its affiliated State employment security agencies also publish work force, employment, and unemployment levels and rates for States and SMSA's. In some instances, area data derived from the CPS may vary from figures published as part of the MA program. Variations occur because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. Following are the basic differences in methods, coverage, and definition between BLS and MA estimates:

(1) The MA unemployment figures are estimated by State employment security agencies, using insured unemployment as a base for the estimate and then applying standardized methods to calculate the unemployment not included in these counts. The latter include persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons who have lost jobs not covered by unemployment insurance systems, such as workers in agriculture, State and local government, domestic service, self-employment, unpaid family work, nonprofit organizations, and firms below a minimum size.[3] The BLS estimates come from a sample survey of the households in the population. Although the concepts of unemployment used are the same, with minor exceptions, the two methods of estimation do result in some differences.

(2) The MA estimates of employment are based on employer payroll records and, therefore, involve some double-counting of multiple job holders. Payroll figures count each job, whereas the household survey counts each person only once. Also, problems of place of work versus place of residence arise. Although both the MA and BLS unemployment estimates are based on where people live, the MA employment estimates are based on where people work, and the BLS estimates count employed persons where they live.

(3) The SMSA boundaries used in the BLS study are those that were in effect in 1960; the MA has updated SMSA definitions for boundary changes made through 1971. Eleven of the 20 largest SMSA's were redefined between 1960 and 1971; they are Baltimore, Boston, Cincinnati, Cleveland, Dallas, Houston, Los Angeles–Long Beach, Milwaukee, St. Louis, San Francisco–Oakland, and Washington, D.C.

(4) The MA unemployment definitions have not yet been adjusted for the changes in definition and coverage that were introduced by the BLS in January 1967.[4]

These differences in methods, definitions, and coverage contribute to the variances in labor force (or work force), employment, unemployment, and unemployment rates in the States and SMSA's covered by both BLS and MA.

Geographic Profile of Employment and Unemployment, 1972

Report 421

U.S. DEPARTMENT OF LABOR
Bureau of Labor Statistics

Preface

This report is the latest in a series of articles presenting geographic labor force data from the Current Population Survey (CPS). It provides 1972 annual averages and limited historical data for regions, large States, and large metropolitan areas. More detailed data for previous years (1967-71) may be found in the following articles and reports: "Jobless Trends in 20 Large Metropolitan Areas" (*Monthly Labor Review*, May 1968); "Unemployment in 20 Large Urban Areas" (*Employment and Earnings*, March 1969); "Unemployment by Region and in Largest States" (*Monthly Labor Review*, January 1970); "Geographic Aspects of Unemployment in 1969" (*Employment and Earnings*, April 1970); *Characteristics of Workers in Large States and SMSA's-1970* (BLS Report 388, April 1971); *Regional Aspects of Unemployment, 1969-70* (BLS Report 395, October 1971); and *Geographic Profile of Employment and Unemployment, 1971* (BLS Report 402, April 1972). Although some of these reports are no longer in print, historical area data from the CPS have also been published in the statistical appendixes to the *Manpower Report of the President.*

This report was prepared in the Bureau's Office of Current Employment Analysis by Christopher G. Gellner and Nicholas I. Peters under the direction of Paul O. Flaim. Appendix C was prepared by Martin Ziegler.

Geographic Profile of Employment and Unemployment, 1972

Introduction

The incidence of unemployment in the United States continued to be unevenly distributed in 1972, not only among the Nation's major labor force groups but also geographically. The annual average unemployment rate in the West, for example, remained higher than in any other region, despite a substantial decline from the levels reached during the recent recession, when this area was particularly hard hit by cutbacks in defense and aerospace employment. In large metropolitan areas, the small decline in unemployment which occurred between 1971 and 1972 was confined to the labor force residing in the suburbs. Joblessness in central cities continued to be much higher on the average than in the suburban areas or in the Nation as a whole.

These are some of the findings from an examination of area data from the Current Population Survey (CPS), the monthly household survey which provides the basic labor force, employment, and unemployment data for the Nation. The area data, presented in tables 1 through 8 of this report, cover the employment status of persons living in the four major regions and nine census divisions, 10 largest States, and 20 large metropolitan areas, including 14 of their central cities.

These data also provide information on the age, sex, and racial composition of the labor force of each area and shed light on the varying incidence of unemployment among the labor force groups at the local level.

Since the data are derived from small samples, they are subject to relatively large sampling errors; the magnitude of the error is inversely related to the size of the population of the area. So that users of these data may correctly assess their reliability, this report contains considerable information on the sampling errors applicable to the data for specific areas (appendix B).

This report also contains a section discussing the comparability of these data with those derived from other sources. This refers essentially to the work force, employment, and unemployment estimates compiled by State employment security agencies. These estimates, a description of which is presented in appendix C, may differ significantly from the CPS estimates because of variations in (1) concepts and definitions; (2) estimating methods; (3) geographic coverage; and (4) sampling variances. The Bureau of Labor Statistics has recently assumed the responsibility for insuring the technical adequacy of the State agency estimates. A review of the State agency estimating procedures is now underway and it is expected that technical revisions will be introduced sometime in the future.

Regions

In 1972, when the unemployment rate for the Nation averaged 5.6 percent, the West continued to have a much higher unemployment rate—7.1 percent. (See table 1.) This relationship has been evident since the early 1960's and reflects particularly high unemployment in the Pacific States. The 1972 rate in the Western States, however, was substantially below the 1971 rate of 8.1 percent, which reflected the effects of the 1970-71 economic slowdown. The unemployment rate for the Northeast, 6.3 percent, was also higher than the national average (as it was in 1971); moreover, this region showed no improvement over 1971 (table 8). The lowest unemployment rates in 1972 were found in the South and North Central regions—4.8 and 5.0 percent, respectively. The rate for the North Central States represented a partial recovery from the effects of the recession, while the rate in the Southern States was about the same as a year earlier. The South was less affected than any other region by the recent economic downturn, due to its limited role in durable goods manufacturing and to strong growth in the service-producing sector of its economy.

The incidence of unemployment among Negroes and members of other minority races[1] was highest in the North Central and Western regions, standing at 12.0 and 11.2 percent, respectively. The national average for Negroes was 10.0 percent. The Negro unemployment rates were 9.4 percent in the Northeast and 9.1 percent in the South. Despite the lower incidence of joblessness among Negroes in the South, the proportion of Negroes

[1] Throughout the rest of this report, the term "Negro" is used to denote the broader "Negro and other races" category. In the 1970 Census of Population and Housing, Negroes constituted 89 percent of this group's population.

working part time for economic reasons (i.e., persons who work part time but want full-time jobs) continued to be much higher in the South than in the other three regions (table 2). In each region, the Negro-to-white jobless rate ratio differed markedly from the national relationship of 2 to 1. Jobless rate ratios substantially higher than the national average were found in the North Central and Southern States, where they were 2.7 to 1 and 2.4 to 1, respectively, whereas the ratios in the Northeast (1.6 to 1) and the West (1.7 to 1) were lower than the national average.

There were also some geographic variations in rates of labor force participation from the national level of 60.4 percent. The highest participation rate was found in the North Central region, where it was 61.7 percent. In contrast, labor force participation was 59.2 percent in the Northeast, primarily reflecting relatively lower participation among adult women, both black and white (table 1). The labor force participation rate for Negroes and members of other minority races was much higher in the West, especially the Pacific States, than elsewhere in the Nation. This stems from the fact that Orientals, who have a very high rate of labor market participation, represent a sizable proportion of persons in the "Negro and other races" category in this region.

Ten largest States

Disparities in unemployment rates continued to be indicated by 1972 data for the Nation's 10 largest States, which, combined, account for about 55 percent of the Nation's civilian labor force and 60 percent of the unemployment. As shown in table 3, unemployment rates varied widely, ranging from a low of 4.5 percent in Texas to 7.6 percent in California.

These unemployment rates reflected to some extent the different degrees of recovery from the economic downturn of 1971. As shown in table 8, jobless rates decreased markedly from their 1971 levels in California, Ohio, Michigan, and Texas, whereas in other States the incidence of unemployment remained essentially unchanged.

Negro jobless rates were highest in the North Central States of Michigan and Ohio and in Massachusetts and California. The incidence of unemployment among Negroes was lowest in New York and Florida. In Florida, however, as in the entire South, a relatively large proportion of Negroes employed were working part time for economic reasons. (See table 4.) The ratio of the Negro-to-white jobless rates also varied widely in the 10 States—ranging from near unity in New York (1.2 to 1) to almost 3 to 1 in Ohio.

The proportion of the population participating in the labor force also displayed some variation from State to State. Participation rates were lowest in Florida, where a relatively large proportion of the population consists of retired people, and were highest in Illinois and Texas.

Metropolitan areas

In 1972, the 20 Standard Metropolitan Statistical Areas (SMSA's) examined in this report accounted, all together, for about one-third of the civilian labor force of the Nation.[2] The unemployment rate for these 20 areas combined, shown in table 5, fell slightly in 1972—from 6.4 to 6.2 percent—after increasing markedly in the previous 2 years. The combined rate for the 20 SMSA's was significantly higher than the national rate, due primarily to high unemployment in the central cities, where the jobless rate (7.2 percent) showed no improvement from 1971. The incidence of joblessness in the suburbs was 5.4 percent, compared with 5.8 percent the previous year.

The unemployment rates for the 20 individual SMSA's (presented in table 6) varied greatly—from 3½ percent in Dallas to 8 percent or more in San Francisco and Buffalo. Of the 20, 13 had jobless rates about equal to or in excess of the national average.

The incidence of joblessness among Negroes in the 20 SMSA's, which contain over two-fifths of the country's Negro labor force, was 10.2 percent, essentially the same as their national unemployment rate. There was little difference between unemployment rates of Negroes residing in central cities and those living in the balance of the SMSA's (suburban counties). However, whereas one-third of the Negro labor force of the Nation resided in the 20 central cities, less than one-tenth lived in the suburbs. Negro jobless rates varied sharply among the individual SMSA's—ranging from about 15 percent in Detroit, Cleveland, and Cincinnati to 6 percent in Dallas.

The rate of labor force participation for the 20 SMSA's combined was 60.7 percent in 1972, close to the national rate of 60.4 percent. Persons residing in the suburbs were more likely to be in the labor force than those living in the central cities, having respective participation rates of 62.4 and 58.5 percent. Labor force participation also differed markedly among the individual SMSA's, varying from only 53 percent in Pittsburgh to 68 percent in Minneapolis and Dallas (table 6).

There were also some differences among the areas in unemployment rates for full- and part-time workers and in the proportion of total unemployment accounted for by the two groups. Areas with high unemployment rates tended to have a high proportion of persons employed on part-time schedules for economic reasons. (See table 7.)

[2] In terms of the data presented in this report, the boundaries of the metropolitan areas are those which were in effect in 1960. For additional information, see appendix A.

[1] Data for individual central cities not shown where civilian force is less than 235,000.

NOTE: In making year-to-year unemployment rate comparisons for individual States, SMSA's, and central cities, one should take into account the relatively wide sampling errors to which the data are subject. The error ranges for the 1972 rates are shown in tables 3 and 6. Error ranges for the rates for previous years are of approximately the same relative magnitudes.

SOURCE: Current Population Survey.

Appendix A. Explanatory Notes

Area definitions

The regional breakdown used in this report is that which has long been used by the Bureau of the Census and utilized in recent BLS publications of regional data derived from the CPS. Under this classification scheme, the 50 States and Washington, D.C. are grouped into four major regions—Northeast, North Central, South, and West. Each of these regions is, in turn, subdivided into two or more divisions.[1]

A new classification scheme—that of 10 Standard Federal Administrative Regions—recently was established to create uniform boundaries and regional office locations for Federal agencies as a means of rationalizing the organization of service delivery systems and to help assure that they are closely coordinated. Compilation of labor force data from the CPS in accordance with these new regional delineations was initated in January 1973. BLS plans to publish these data beginning with the annual averages for 1973, and to explain the relationship between the new figures and the existing series.

The States and SMSA'S for which data are presented in this report are the largest in terms of their 1960 population. Also, as used in this report, the boundaries of the 20 SMSA's are those which were in effect in 1960.[2] SMSA boundaries may encompass one or more large cities as well as adjacent suburban counties. "Central city" refers to the population within the corporate limits of the city or cities named in the SMSA title. Central city data are not shown separately where the 1972 civilian labor force estimates were below 235,000. The "suburbs" referred to in this report are those parts of the SMSA's which lie outside the central cities.

Labor force information by detailed age-sex-color groups is not being published for those areas subject to large sampling errors, as explained in appendix B. Specifically, data are not shown where the civilian labor force estimate is less than 50,000 or the unemployment estimate is below 5,000. Nevertheless, all area-to-area comparisons of labor force characteristics should be made with caution, utilizing the generalized standard error tables presented in tables B-1 through B-11 in appendix B.

Independent population estimates

The 1972 findings from the CPS for the 10 States and 20 metropolitan areas have been applied to independent population estimates made by the Bureau of the Census; these estimates are derived largely from projections based on the 1970 Decennial Census and relate to the size of the population as of July 1, 1972, the year's midpoint.

State and local area data from the CPS for 1970 and 1971, as published in BLS Reports 338 and 402, also were adjusted on the basis of data derived from the 1970 Census. Published State and local area data from the CPS for 1968 and 1969, in contrast, were originally adjusted to independent population estimates derived from projections based on the 1960 Decennial Census. Subsequently, the Bureau of the Census provided BLS with data permitting a readjustment of 1969 and 1968 annual average estimates consistent with the findings from the 1970 Census. In the evaluation of any changes in State and local estimates since 1968, the revised 1968

[1] The Northeast region consists of two divisions: *New England*—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut; and *Middle Atlantic States*—New York, New Jersey, and Pennsylvania. The North Central region consists of two divisions: *East North Central States*—Ohio, Indiana, Illinois, Michigan, and Wisconsin; and *West North Central States*—Iowa, Minnesota, Missouri. North Dakota, South Dakota, Nebraska, and Kansas. The Southern region consists of three divisions: *South Atlantic States*—Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida; *East South Central States*—Kentucky, Tennessee, Alabama, and Mississippi; and *West South Central States*—Arkansas, Louisiana, Oklahoma, and Texas. The Western region consists of two divisions: *Mountain States*—Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, and Nevada; and *Pacific States*—Washington, Oregon, California, Alaska, and Hawaii.

[2] For a listing of the SMSA boundary changes introduced during the 1960 decade, see Christopher G. Gellner, "Occupational Characteristics of Urban Workers," *Monthly Labor Review*, October 1971, page 30, reprinted as Special Labor Force Report 138.

1969 figures should be used. These can be obtained from the Office of Current Employment Analysis, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

Unlike State and local estimates, regional data from the CPS have not been adjusted to updated independent population estimates.

Comparability with labor force statistics from other sources.

Except for the adjustment process for population data discussed above, the CPS area data are completely independent of data from the 1970 Decennial Census. Moreover, the time reference of the CPS differs from that of Census data—the CPS data are annual averages of 12 separate monthly estimates, whereas the estimates from the Census relate only to April 1970. Thus, 1970 area labor force estimates from the CPS found in table 8 and also published in BLS Reports 388 and 395 may differ significantly from area data published from the 1970 Decennial Census. Information on the comparability of the data from these two sources can be obtained by writing to the Office of Current Employment Analysis, Bureau of Labor Statistics. The comparability of the CPS area data with work force, employment, and unemployment estimates computed by government agencies of the individual States is discussed in detail in appendix C.

Appendix B. Statistical Reliability of CPS Estimates

Since the area labor force estimates presented in this report are derived from a sample survey, they may differ somewhat from the estimates that would be obtained if a complete count were taken in the areas. The range of this "sampling error" for all of the annual average data shown in this report can be calculated from standard error tables B-1 through B-11 which follow.

Since the statistical variability of the regional estimates derived from the CPS is only slightly greater than that of national data, error tables established for national figures are presented for use in calculating reliability estimates for the regional data. (See tables B-1 and B-2.) The chances are about 68 out of 100 that regional sample estimates would differ by less than their respective standard errors from labor force figures which would have been obtained from a complete count. For a greater degree of statistical reliability (i.e., 90 chances out of a 100), standard error figures should be multiplied by 1.6.

The CPS estimates for States and metropolitan areas presented in this report have a much larger range of statistical variance than national or regional data. For this reason, separate standard error tables are provided for use with these estimates. They should be utilized in making any comparisons between States, between metropolitan areas, or over time. These tables, however, do not provide the error on changes between consecutive years. For labor force and employment levels, the error on changes between consecutive years is slightly smaller than the error for a given year's level; for unemployment data, it is about the same. Standard errors for use in calculating the reliability of these data are presented below in tables B-3 through B-11. The error ranges in tables 3 and 6 of this report have been calculated on the basis of 1.6 times the standard error, i.e., to a 90-percent degree of confidence.

Appendix C. Employment and Unemployment Estimates of State Employment Security Agencies

Under a Federal-State cooperative program of the U.S. Department of Labor, State employment security (ES) agencies develop monthly estimates of employment, unemployment, and the work force for States and 150 major labor areas.[1] The Manpower Administration uses these data to determine the eligibility of States and areas for Federal assistance and to allocate funds under various manpower programs. In November 1972, under a statistical reorganization within the Department of Labor, the Bureau of Labor Statistics was given responsibility for insuring the technical adequacy of these statistics.[2] BLS is now reviewing the current estimating procedures and, after this period of study and experimentation, will issue a new series of handbooks incorporating revised estimating procedures where necessary to improve technical reliability.

This appendix includes two statistical tables relating to the State agency estimates. Table C-1 presents the employment, unemployment, and work force data for the 10 largest States and 20 major labor areas corresponding to the CPS areas published in this report. Table C-2 compares the geographic boundaries of the 20 major labor areas with those of the same CPS areas.

A comparison between the current State agency estimates and the CPS data on employment, unemployment, and labor force may reveal some striking differences. Most of the differences occur because of variations in (1) concepts and sources of data, (2) estimating methods, (3) geographic boundaries, and (4) sampling variances.

Concepts and sources of data

Employment. State ES agency estimates of employment are derived largely from establishment payroll records. These counts of nonagricultural wage and salary employment, which account for 90 percent of total employment, are based on the worker's place of work, not his place of residence. This means that workers living outside the boundaries of the labor area but working within it are included. Conversely, workers living within the labor area but working elsewhere are excluded from the area's count. Thus, to the extent that there is net incommuting, the State agency employment estimates will tend to exceed CPS area estimates. Moreover, the State agency employment estimates, since they are based upon establishment payroll data, in some cases count persons more than once due to dual jobholding and other reasons.

State agency estimates for the remaining 10 percent of total employment—which includes agricultural workers, private household workers, the self-employed, and unpaid family workers—are developed by extrapolating Census of Population benchmarks. (Employment counts from the Census are based on place of residence.)

In the CPS, all data are derived exclusively from responses by household members to a survey questionnaire in which workers are counted where they live and not where they work. Persons with more than one job are counted only once. Persons with a job but not at work for such reasons as temporary illness, bad weather, vacation, or labor-management disputes are counted as employed. (Such persons would only be counted as employed by State ES agencies if they were paid during the survey week.)

Unemployment. State agency estimates of total unemployment are "built up" from a count of insured unemployment derived from the administrative records of the State unemployment insurance (UI) systems. Because of differences in State UI laws and administrative regulations, claimant eligibility for benefits varies from State to State.[3] Although an attempt is made to reconcile these differences, they may be reflected in the count of the insured unemployed and thus in the estimates of total unemployment.

[1] Estimates for parts of major labor areas and for smaller areas are also developed periodically.

[2] Prior to November 1972, the Manpower Administration was responsible for the technical adequacy of the State and area statistics.

[3] However, all State UI laws or administrative procedures require that, in order to be eligible for benefits, a claimant must be physically able to work and available for work.

In most States, specified small amounts of earnings are disregarded in determining the eligibility of claimants for benefits. Thus, claimants earning pay or profit below a "forgiveness" level are counted as totally unemployed in the UI system. The CPS would count such workers as employed. In addition, most States pay partial benefits to workers who are unemployed less than a full week, even though their earnings exceed the "forgiveness" level. However, provision is made in the State agency estimating methods to exclude those workers from the estimate of total unemployed, shown in table C-1.

In some States, UI benefits are paid to workers temporarily separated from their jobs for such reasons as bad weather, unpaid vacation, and a labor-management dispute. Although such workers may be unpaid during the survey week, they are included among the employed in the CPS unless they indicate they were on temporary layoff.

UI statistics are usually compiled on a local employment office basis. In many States the count of the insured unemployed covers the geographic jurisdiction of the local office, not the geographic residence of claimants. In these cases, commuters living outside the SMSA and filing claims in local offices located within the SMSA are counted where they file, not where they live. Also, where counts are not made by place of residence, out-of-State commuters filing claims in person in a bordering State are counted where they file, not in the State where they live.[4]

Insured unemployment will typically constitute between 25 and 50 percent of total unemployment, depending on economic conditions, the industrial composition of the State or area, and individual State UI laws. Not included among the insured unemployed are workers who exhausted their UI benefits, those who were eligible but failed to file a claim, those who were ineligible because of insufficient earnings, and those disqualified for voluntarily quitting their job or for being discharged for misconduct or for other reasons. Also not included are workers employed in industrial establishments not covered under UI, farm workers, and workers with no recent earnings who are entrants or reentrants to the labor force.

In order to develop a total unemployment estimate, State ES agencies use a 70-step estimating methodology to build up an estimate from insured unemployment data. The estimating methods are summarized in another section of this appendix.[5]

The CPS unemployment data are derived from specific questions in the household survey which determine labor force status and availability for work. Unemployment includes all persons who did no work for pay or profit during the survey week, made specific efforts to find work within the previous 4 weeks, and were available for work, except for temporary illness. Also counted as unemployed are persons who were available for work but did not work because they were waiting to be called back to a job from which they had been temporarily laid off or were waiting to report to a new wage or salary job within 30 days.

Labor force vs. work force. In the CPS, the civilian labor force is an unduplicated sum of the resident employed and the resident unemployed. State employment security agencies develop their work force estimates by summing the estimates of area employment, unemployment, and persons directly involved in labor-management disputes. (The last category includes workers who are part of a bargaining unit as well as other workers employed by the establishment who are unable to work because of the dispute. In the CPS, those on strike are included among the employed but persons laid off as a direct result of a strike are counted as unemployed.)

The State agency work force concept is neither a pure residence concept nor a pure establishment concept. The employment part is largely on a place-of-work basis, whereas the unemployment part is derived from insured unemployment data which are based on where a worker files his claim. This may be either where he lives or where he works (except for the few States which tabulate UI claims by residence). For 9 out of 10 States and for all nine of the SMSA's where the CPS and State agency boundaries are identical, the State agency work force estimates are higher than the CPS labor force estimates. (See table C-1).

Estimating methods

Employment. State ES agencies develop separate estimates of (1) nonagricultural wage and salary employment, (2) all other nonagricultural employment, and (3) farm employment.

Nonagricultural wage and salary employment is derived from a sample of establishments canvassed by mail questionnaire each month. Among other items, employers report total employment and payrolls for the survey week. Quarterly reports of total employment and payrolls for all establishments covered under the unemployment insurance system are also received by State employment security agencies—about 6 months after the end of the quarter. Each year, the State

[4] Several States have made special provision to tabulate claimants by county of residence.

[5] Also, see *Handbook on Estimating Unemployment* (U.S. Department of Labor, March 1960) (out of print).

employment security agencies "benchmark" the employment estimates developed from the sample establishments covered under UI to the universe count of employment, obtained from the quarterly reports.

The employment for establishments not covered by UI is benchmarked to universe estimates obtained from various government sources, including the Railroad Retirement Board, State and local governments, and the Census of Population.

"All other" nonagricultural employment, which includes private household workers, the self-employed, and unpaid family workers, is derived by extrapolating Census of Population estimates. The extrapolation procedure incorporates the "all other" employment trend from the CPS (for the Nation as a whole) and the wage and salary employment trends for the area and the Nation.

Farm employment is also derived by extrapolating Census of Population estimates for States and areas. Extrapolators for State estimates incorporate the monthly farm employment estimates of the U.S. Department of Agriculture. For SMSA's , which have little farm employment, a simple time trend may be used if local source data are not available.

Unemployment. The estimating methods used by State ES agencies were developed by the Manpower Administration to reflect the adminstrative data available from the Federal-State UI system.

Under this system, States are free to develop their own UI program, subject to minimum standards established by Federal law. Under Federal law, States must cover all but the following types of employment: (1) Agricultural labor, (2) domestic services, (3) self-employed and unpaid family workers, (4) certain types of nonprofit groups, and (5) State and local government employees (except in hospitals and institutions of higher learning). However, a number of States have elected to broaden the coverage of their UI law to include one or more of the types of employment listed above.

States may impose additional restrictions on claimant eligibility on the basis of prior earnings and the duration of previous employment. States also disqualify claimants who quit jobs or are discharged for cause or fail to meet current tests of availability. Since no two State UI programs are alike, the data generated from these programs are adjusted to reconcile differences wherever possible.

Total unemployment is the sum of the estimates for three major groups: (1) Unemployed in industries covered under UI, (2) unemployed in noncovered industries, and (3) unemployed new entrants and reentrants. The first group is the most important, because it contains the base for the entire estimating procedure—the insured unemployed. This figure is obtained from a count of claims filed in local employment offices. In addition, it includes claimants who have exhausted their UI benefits but continued to look for and are available for work. Some States conduct special post-exhaustion studies to determine the labor force status of their former beneficiaries. Also included under the first group are disqualified claimants and those who fail to file for benefits on a timely basis or who never file. Their unemployment is estimated from followup studies conducted by the State agencies.

The second group includes persons employed in industries not covered under the provisions of State UI laws. The estimating methodology is based on assumed statistical relationships between "covered" and "noncovered" unemployment developed from national CPS data.

The third group—unemployed new entrants and reentrants—includes persons with no previous work experience and those reentering the labor force after a period of withdrawal. This unemployment category is estimated by applying statistical factors to the area work force and the experienced unemployed. The size of these factors varies with the proportion of youth in the population of each area. The statistical relationships used in the estimating procedures were also developed from national CPS data.

Geographic boundaries

The geographic boundaries of the 20 major labor areas of the State agencies are identical with the boundaries of Standard Metropolitan Statistical Areas as they existed in 1972, whereas the CPS area boundaries for the 1972 data were those in effect in 1960, at the time of the Census of Population.

Eleven of the 20 labor areas shown in table C-2 had boundaries which differed from those of the CPS areas in 1972. In nine cases, the labor areas used by the State agencies were larger than the CPS areas because one or more suburban counties had been added to the SMSA since the 1960 Census. Two labor areas (in California) were smaller than their CPS counterparts.

Sampling variances

The CPS is based on a sample of households selected from a universe listing of dwelling units in the United States. It is possible to measure the sampling errors

associated with the estimates derived from this survey, since each household is selected with a known mathematical probability.

Because ES estimates are not derived from a probability sample, precise measures of their reliability cannot be developed. However, it is possible to compare the two estimates to determine if they are statistically different. If the ES estimates fall within the range of 1.6 standard errors of the CPS measure, then there is a 90-percent probability that the two estimates are not significantly different. To facilitate such tests, tables 3 and 6 in the body of this report show the range of sampling error for the CPS unemployment rate.

Table C-1. Estimates of work force, employment, and unemployment

State and area	1972 annual average (numbers in thousands)

Preface

This report is the latest in a series presenting geographic labor force data from the Current Population Survey (CPS). It provides 1973 annual averages and limited historical data for regions, large States, and large metropolitan areas. More detailed data for previous years may be found in the following articles and reports: *Characteristics of Workers in Large States and SMSA's—1970* (BLS Report 388, 1971); *Employment in Perspective: Regional Aspects of Unemployment 1969-70* (BLS Report 395, 1971); *Geographic Profile of Employment and Unemployment, 1971* (BLS Report 402, 1972); *Geographic Profile of Employment and Unemployment, 1972* (BLS Report 421, 1973); and "Regional Differences in Employment and Unemployment, 1957-72" *(Monthly Labor Review,* March 1974). Although some of these reports are no longer in print, historical area data from the CPS have also been published in the statistical appendixes to the *Manpower Report of the President.*

This report was prepared in the Bureau's Office of Current Employment Analysis by Christopher G. Gellner, Nicholas I. Peters, and Diane N. Westcott under the direction of Paul O. Flaim. Appendix C was prepared by Martin Ziegler.

   Unemployment rate 26

Geographic Profile of Employment and Unemployment, 1973

Introduction

Unemployment continued to vary substantially on a geographic basis in 1973 but was lower in most areas than in 1972, based on an examination of annual average labor force data by area from the Current Population Survey (CPS) tabulated for the 10 Federal administrative regions, 19 large States, and the 30 largest metropolitan areas. Some areas were examined for the first time in this report, which expands the number of States and metropolitan areas shown separately, and introduces the Federal Administrative Regions classification system. (See appendix A.)

The overall unemployment rate in 1973 continued to be highest in the far West and lowest in the Southeastern and West North Central sections of the country. The incidence of unemployment among Negroes[1] tended to be high in the heavily industrialized East North Central United States. These relationships were generally evident among States and SMSA's as well as regions.

Regions

When computed on the basis of the new Federal Administrative Regions classification system, the incidence of unemployment in 1973 ranged from a low of 3.8 percent in region VII in the West North Central part of the Nation (see table 1 for States included) to around 6.8 percent in the two westernmost areas—regions IX and X. In the Northeastern section of the country, region I (which includes all the New England States) and region II (New York and New Jersey) had unemployment rates of 6.0 and 5.5 percent, respectively, somewhat above the national average of 4.9 percent. In constrast, the jobless rate in region V—the heavily industrialized Midwestern States—was lower than the national average, at 4.5 percent.

Since data for the administrative regions were tabulated for the first time in 1973 and since the boundaries of these regions do not in most cases conform with those of the Census regions and divisions used in the tabulation of CPS data for previous years, one can make few precise comparisons with regional data collected previously.[2] In general, however, the regional findings for 1973 seem fairly consistent with those for past years based on the old Census classification. (See table 6.) For example, the incidence of unemployment in 1973 continued to be relatively low in the Southeastern States (region IV) as well as in the Plains and Mountain States (regions VII and VIII) and highest in the far West, especially on the Pacific Coast—regions IX and X. All of the regions, however, seemed to show lower unemployment than in 1972.

The incidence of unemployment among Negroes in 1973 was highest in regions I (New England) and X (the Pacific Northwest) where it averaged close to 12 percent; the lowest unemployment rate for Negroes was 7.1 percent in region VIII (North and South Dakota, Montana, Wyoming, Utah, and Colorado). These three regions, however, contain only very small proportions of the Nation's nonwhite labor force, and thus the figures are subject to a high degree of statistical error.[3] The Negro unemployment rate was also high (10.8 percent) in region V (the industrialized Midwestern States), a region with a relatively high concentration of Negro workers. In region IV, which contains most of the Southern States with a large Negro population, the jobless rate for Negroes was 8.1 percent, about a percentage point below the national average. However, regional data for 1973 continued to indicate a much higher incidence of underemployment (persons wanting full-time jobs but working only part time) in the Southern areas (both regions IV and VI) than in other

[1] The terms "Negro" or "black" are used throughout this report to denote the broader "Negro and other races" category. Nationwide, Negroes constituted 89 percent of this group's population in the 1970 Census of Population and Housing.

[2] Region I is the only region whose boundaries coincide with those of a Census division, specifically, with the New England division.

[3] Moreover, it should be noted, with regard to both regions VIII and X, that the Negro proportion of the racial minorities in these areas may be relatively small. American Indians make up a substantial proportion of the minority population in region VIII and, along with Eskimos and Aleuts, also account for a large proportion of the minority population in region X.

regions of the country. (See table 2.) The Negro-to-white jobless rate ratio ranged from a low of 1.5 to 1 in regions II and IX to 3.1 to 1 in regions VI and VII.

Rates of labor force participation also showed substantial variation among the regions (table 1). The highest participation rates were in regions I, V, VIII, and X, where they were about 63 percent, above the national rate of 60.8 percent. The lowest rate, 58 percent, was in region II. Men, women, and teenagers, both black and white, were less likely to be in the labor force in this region than in the Nation as a whole.

Nineteen large States

The improvement in the national employment situation in 1973 was clearly reflected by the data for 19 large States. Nearly all of these States, which together accounted for 75 percent of the Nation's civilian labor force and 77 percent of the unemployed in 1973, experienced a decline in joblessness relative to the previous year. The degree of improvement, however, varied substantially between States. New York, Ohio, Michigan, Maryland, and Washington recorded particularly large declines in their jobless rates; many other States posted only marginal changes.

As indicated in table 3, there continued to be a wide disparity between State unemployment rates. California and Washington, which have consistently had the highest unemployment rates among the large States, maintained this position with jobless rates of 7.0 percent or more in 1973. Maryland, North Carolina, and Virginia experienced unemployment rates of around 3.5 percent—much lower than the national average.

The incidence of joblessness among Negroes varied. It was generally high in the Midwestern States, where their jobless rates ranged from 10 to 14 percent, and relatively low in the States along the South Atlantic Coast, where their rates ranged from 6 to 8 percent.

Rates of labor force participation for individual States were generally close to the national rate of 60.8 percent. However, Florida continued to have a low participation rate (55.2 percent), as a relatively large proportion of its population is made up of retired persons. Minnesota, North Carolina, and Wisconsin had the highest participation rates—above 65 percent.

Metropolitan areas

Unemployment in large urban areas continued to run slightly above the national average in 1973. An aggregation of data for the 30 largest Standard Metropolitan Statistical Areas (SMSA's)—which accounts for approximately 33 million workers, or 38 percent of the Nation's civilian labor force—yielded a jobless rate of 5.3 percent, compared with the national average of 4.9 percent. As shown in table 4, the higher unemployment rate for the 30 SMSA's reflected the relatively high incidence of joblessness in the central cities (6.1 percent); the unemployment rate for the suburbs, 4.8 percent, was marginally below the national average. The difference in unemployment rates between central city and suburbs applied only to whites; for Negro workers there was no significant difference in joblessness between those residing in the central cities and those living in the suburbs. Black women residing in these large SMSA's continued to experience an unemployment rate lower than their national average, whereas black men in these urban areas had a higher than average unemployment rate.

Unemployment rates for individual SMSA's differed widely in 1973. As shown in table 5, rates ranged from a low of 2.5 percent in Dallas to 7 percent or more in such West Coast areas as San Diego, Seattle–Everett, and San Francisco–Oakland, and in Buffalo.

The incidence of black joblessness varied markedly among individual SMSA's; it was substantially below the national average for black workers in Chicago, Baltimore, Washington, D.C., and Dallas and substantially above in Detroit, Kansas City, Cincinnati, Milwaukee, and San Francisco–Oakland.

The labor force participation rate for the 30 SMSA's combined, at 61.2 percent, was somewhat above the national average. Participation among central city residents, at 58.9 percent, was significantly lower than among suburban residents, who had a participation rate of 63.0 percent.

There was also a wide degree of variation among individual SMSA's, with overall participation rates ranging from 54.0 percent in Pittsburgh to 69.2 percent in Minneapolis–St. Paul. This variation stemmed mostly from large differences among adult women.

[1] The SMSA's for which data are aggregated in this table are listed individually in table 5.

[2] Data for the central cities only cover 29 areas. Nassau-Suffolk (N. Y.), which was classified as a separate SMSA by the Office of Management and Budget in 1973, has no central city and thus is classified in its entirety as a suburban area.

NOTE: The 30 SMSA's are based on 1970 boundary definitions. Individual items may not add to totals or subtotals due to rounding.

Table 5. Employment status of the civilian noninstitutional population 16 years and over in the 30 largest SMSA's and selected central cities by color, sex, and age, 1973 annual averages

[1] Because of boundary changes, data for 1973 are not in all cases comparable with data for earlier years.
[2] Data are not available for years before 1973.

Appendix A. Explanatory Notes

Geographic Profile of Employment and Unemployment, 1973 is the latest in a series of annual reports published by the Bureau of Labor Statistics presenting labor force data for regions, States, and SMSA's (metropolitan areas) and their central cities. All data in the report are annual averages derived from the Current Population Survey (CPS), a monthly sample survey of approximately 47,000 households conducted throughout the United States. This year's report introduces a new regional classification scheme based on the 10 Federal administrative regions. It also provides labor force data for more States and metropolitan areas than earlier reports provided.

Area definitions

The 10 Standard Federal Administrative Regions for which data are introduced in this report were established several years ago to create uniform boundaries and regional office locations for the administration and coordination of Federal programs. Under the Federal Administrative Regions classification system, the United States is divided into 10 regions as follows: *Region I*—Maine, Vermont, New Hampshire, Massachusetts, Connecticut, and Rhode Island; *Region II*—New York and New Jersey; *Region III*—Pennsylvania, Maryland, Delaware, West Virginia, Virginia, and the District of Columbia; *Region IV*—Kentucky, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, and Mississippi; *Region V*—Ohio, Indiana, Illinois, Michigan, Wisconsin, and Minnesota; *Region VI*—Arkansas, Louisiana, Oklahoma, Texas, New Mexico. *Region VII*—Missouri, Iowa, Nebraska, and Kansas; *Region VIII*—North Dakota, South Dakota, Montana, Wyoming, Utah, and Colorado; *Region IX*—California, Nevada, Arizona, and Hawaii; *Region X*—Idaho, Oregon, Washington, and Alaska. (See inside back cover.)

Under the traditional Census Bureau classification, the United States was divided into four regions, each of which was further subdivided into two or more divisions. The Northeast region consisted of two divisions: *New England*—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut; and *Middle Atlantic States*—New York, New Jersey, and Pennsylvania. The North Central region consisted of two divisions: *East North Central States*—Ohio, Indiana, Illinois, Michigan, and Wisconsin; and *West North Central States*—Iowa, Minnesota, Missouri, North Dakota, South Dakota, Nebraska, and Kansas. The Southern region consisted of three divisions: *South Atlantic States*—Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida; *East South Central States*—Kentucky, Tennessee, Alabama, and Mississippi; and *West South Central States*—Arkansas, Louisiana, Oklahoma, and Texas. The Western region consisted of two divisions: *Mountain States*—Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, and Nevada; and *Pacific States*—Washington, Oregon, California, Alaska, and Hawaii.

With the introduction of the new classification system, publication of detailed labor force data for the traditional Census regions and divisions is being discontinued. However, the 1973 unemployment rates for these regions and divisions are shown, together with data for previous years, as part of table 6.

Of the 19 States for which data are presented in this report, the first 16 in order of tabular presentation are the largest in terms of their 1970 populations. Data for the other three States—Maryland, Minnesota, and Washington—are deemed to be sufficiently reliable for publication, although these States do not immediately follow the other 16 in order of population size. The statistical adequacy of the CPS data for States other than these 19 is currently being studied, and, if warranted, additional States will be covered in future reports. In previous reports, CPS data were published only for the 10 largest States.

The Office of Management and Budget is responsible for defining Standard Metropolitan Statistical Areas (SMSA's) as well as for determining the exact boundaries of each area. Except for the Nassau-Suffolk SMSA, which has no central city, SMSA's consist of the areas

within the corporate limits of one or more large cities named in the SMSA title and the surrounding contiguous counties that have close economic ties to these cities. Generally, the SMSA portion outside the central city or cities is referred to as "suburbs" or "suburban ring."

The 30 SMSA's for which data are presented in this report are ranked according to their 1970 populations. With the exception of New York and Nassau–Suffolk, the 1973 population counts reflect the SMSA's boundaries in effect in *1970*, whereas the data for previous years (as shown in table 6 and as published in other sources) reflected the *1960* boundaries. Data for the New York and Nassau-Suffolk SMSA's reflect changes made in late 1972, when the counties of Nassau and Suffolk were severed from the New York SMSA and made into a separate and distinct metropolitan area. Although Paterson–Clifton–Passaic would have been ranked among the 30 largest SMSA's in 1973 on the basis of its 1970 boundaries, it has been removed from the publication list because of a recent boundary change which resulted in a substantial reduction in its size. A series of further SMSA boundary changes, which were announced during 1973 and resulted generally in the annexation of more counties into the SMSA's, will become fully reflected in the data beginning with 1974 annual averages. Several SMSA's will experience very large changes at that time, most notably Atlanta and New York.

Central city data are shown separately for the 14 SMSA's for which such data were published in previous years. Data for central cities of additional SMSA's are being developed and evaluated for possible future publication.

Because of the potentially large sampling error for estimates based on relatively few sample observations, demographic groups for which the labor force estimate is less than 50,000 are not shown separately. Sampling errors for the data in this report may be computed by using the tables in appendix B.

Independent population estimates

The 1973 labor force estimates from the CPS for the 10 administrative regions, 19 large States, 29 of the 30 largest metropolitan areas (Boston being the only exception), and 5 of the central cities (New York, Philadelphia, Washington, D.C., Baltimore, and St. Louis) have been adjusted to independent population estimates developed by the Bureau of the Census. Each population control relates to the State or area's population on July 1, 1973.

State and local area data from the CPS for 1970, 1971, and 1972, as published in BLS Reports 388, 402, and 421, were also adjusted in the same way to independent population estimates projected from the 1970 Decennial Census. State and local area data from the CPS for 1968 and 1969, however, were originally published on the basis of population estimates derived from the 1960 Decennial Census; subsequently, the Bureau of the Census provided BLS with information permitting a readjustment of annual average estimates for these 2 years consistent with the findings from the 1970 Census. When evaluating any changes in State and local estimates since 1960, the revised 1968 and 1969 figures should be used. They can be obtained from tables D-11 and D-12 of the *1972 Manpower Report of the President* or by writing to the Office of Current Employment Analysis, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

Comparability with labor force statistics from other sources

Except for the adjustment process for population data discussed above, the CPS area data are completely independent of data from the 1970 Decennial Census and thus may differ from area data from that Census, as well as from data provided by other surveys or administrative records. The comparability of the CPS area data with work force, employment, and unemployment estimates computed by government agencies of the individual States, as well as the new role of CPS estimates in benchmarking the individual State agency estimates, is discussed in appendix C.

Appendix B. Statistical Reliability of CPS Estimates

Since the area data in this report are derived from the Current Population Survey, a nationwide survey with a sample consisting of less than 0.1 percent of all households in the country, they may differ from the estimates that would be obtained if a complete census of the area were taken. Generally, the magnitude of the sampling error for area estimates is inversely related to the size of the area's population. So that users of the data may be able to assess their reliability, standard error tables for State and metropolitan area estimates are provided in this appendix. When the respective standard errors are applied to individual estimates, the resulting ranges, or confidence intervals, that can be derived would, in about 68 percent of the cases, contain the measurements that would be obtained from a complete count. In order to construct 90-percent confidence intervals—which would be expected to contain the measurements from a complete count in 90 out of 100 cases—the standard errors must be multiplied by 1.6. Standard errors of the changes between estimates for consecutive years are not presented; generally, they are smaller, relative to the errors for a single year's data, with respect to civilian labor force and employment data and about the same with regard to unemployment data.

Specific standard errors for labor force data by region have not been computed. For regions with a large population (such as regions II, III, IV, V, VI, and IX) the errors are relatively small and may be approximated by using the error tables for national data published monthly at the back of *Employment and Earnings*. Errors for the smaller regions may be computed by using the error data published in this report for States with approximately the same population size.

Appendix C. Employment and Unemployment Estimates of State Employment Security Agencies

Under a Federal-State cooperative program of the U.S. Department of Labor, State employment security agencies have developed estimates of employment and unemployment for States, labor areas, cities, and counties for a number of years. The Manpower Administration uses these data for apportioning Federal funds for local labor market analysis and for local program purposes. In the past, these estimates were totally independent of—and often differed substantially from—the estimates for the same areas derived from the Current Population Survey. These differences primarily reflected differences in the conceptual and methodological framework of the two programs. In November 1972, under a statistical reorganization within the Department of Labor, the Bureau of Labor Statistics was assigned responsibility for revising the concepts and methods utilized in preparing such estimates. After extensive research and consultation with other Federal and State agencies, new technical procedures for estimating labor force, employment, and unemployment were introduced late in 1973. A review of the most important changes is provided below.

Employment

The procedure for estimating total employment by area has been substantially revised. Under the new procedure, the total employment estimates are on a "persons-by-place-of-residence" basis. Under the old procedure, a large share of the total employment estimate for a given State or area was on a "jobs-by-place-of-work" basis. There are two important reasons for this change. First, all other things being equal, the count of jobs will exceed the count of employed persons because some workers are on more than one payroll record during a given survey period—for example, nationally, about 5 percent of all employed workers hold more than one job. Second, the change to a place-of-residence rather than a place-of-work basis, while not affecting State totals appreciably, can modify estimates in most sub-State areas where there is substantial commuting to work—either into or out of the area. Several other changes in the procedure will result in changes in the estimates of agricultural employment, self-employment, and employment of domestics. On an annual basis, data for 19 States and 30 large metropolitan areas will be benchmarked to estimates for the same areas drawn from the Current Population Survey.

Although the definition and method of estimating total employment have been changed, definitions and procedures of estimating nonagricultural wage and salary employment by industry—the count of payroll jobs by place of work—remain exactly the same as in the past.

Unemployment

Unemployment estimates computed by State employment security agencies are developed by following a building block approach, which uses data from a variety of administrative and survey sources. The major source of data is a count of the insured unemployed derived from the administrative records of the State unemployment insurance (UI) system. Because UI laws and administrative regulations vary from State to State, differences in the levels of insured unemployment between States may not necessarily correlate with differences in total unemployment. Although an attempt is made to reconcile these differences, empirical evidence indicates that the estimates of total unemployment for States still reflect differences in the eligibility provisions of State UI laws. To minimize these distortions, the building block estimates are benchmarked to estimates from the national survey wherever possible. For 1973 this involved 19 States and 30 SMSA's. During 1974, the number of areas that are benchmarked probably will be increased, and the procedures for making estimates for the other areas will be reviewed and revised to bring them into the closest possible alignment with Current Population Survey concepts.

Labor force

Under the new procedure, the work force concept, based largely on a count of jobs by place of work, has been replaced with a labor force concept. Labor force estimates are the sum of employed and unemployed

persons by place of residence. In general, the labor force estimate for an area will differ from the work force estimate, with the difference reflecting the adjustments to remove both the effect of multiple jobholding and the effect of commuting.

Unemployment rate

The total unemployment rate is the ratio of the number of unemployed to the total labor force. Under the revised methodology, unemployment rates for most areas will differ from those prepared by following the old procedure, with the largest modifications in areas where there is substantial commuting to work—either into or out of the area. The adjustment for commutation provides unemployment rate estimates that are much more comparable from area to area.

1976

Report 452

U.S. Department of Labor
W. J. Usery, Jr., Secretary
Bureau of Labor Statistics
Julius Shiskin, Commissioner
1976

Preface

This report is the latest in a series presenting geographic labor force data from the Current Population Survey (CPS). It provides 1974 annual averages for large States and large metropolitan areas. Data for previous years may be found in the following articles and reports: *Characteristics of Workers in Large States and SMSA's–1970* (BLS Report 388, 1971); *Employment in Perspective: Regional Aspects of Unemployment, 1969-70* (BLS Report 395, 1971); *Geographic Profile of Employment and Unemployment, 1971* (BLS Report 402, 1972); *1972* (BLS Report 421, 1973); *1973* (BLS Report 431, 1974); and "Regional Differences in Employment and Unemployment, 1957-72" *(Monthly Labor Review,* March 1974). Historical data from the CPS for States and areas have also been published in the statistical appendixes to the *Manpower Report of the President.*

This report is a joint product of the Office of Employment Structure and Trends and the Office of Current Employment Analysis, and was prepared by Fred Cronkhite, with assistance from Sandy Grove and Marian Hester. Appendixes A and C were prepared by Martin Ziegler.

Introduction

This edition of the *Geographic Profile* is presented in two sections. Section I contains the official 1974 annual average total unemployment estimates for 27 large States and 30 large metropolitan areas which were used by the Department of Labor in 1975 for the allocation of funds under the Comprehensive Employment and Training Act (CETA), and for other program purposes. These estimates were based, either directly or indirectly, on the Current Population Survey (CPS).

Section II presents 1974 CPS annual average demographic and occupational estimates for 25 large States and 28 large Standard Metropolitan Statistical Areas (SMSA's). This is the first time that CPS occupational estimates have been published for States. In some cases, the SMSA totals in Section II are different from the metropolitan area estimates in Section I. This is due to differences in the geographic definitions of the areas.

Section I. Total Labor Force and Unemployment Estimates for CETA AND Other Programs

Tables 1 and 2 present annual average estimates for 27 large States and 30 metropolitan areas used in 1975 for CETA and other program purposes. These annual averages are a combination of CPS sample estimates, estimates resulting from adjustments to SMSA boundaries to conform with labor market area definitions, and synthetic estimates which result from the "outlier" adjustment. (See appendix C.) The total unemployment estimates for Illinois, Michigan, and the Chicago and Detroit SMSA's were declared outliers in 1974 and were adjusted using this procedure.

All metropolitan areas shown in table 2 are Labor Market Areas (LMA's) defined by the Department of Labor. Twenty-seven of these areas have geographical boundaries that are coterminous with SMSA boundaries defined by the Office of Management and Budget (OMB). Three areas–New York, Minneapolis-St. Paul, and Denver-Boulder–are SMSA's adjusted to conform with LMA definitions. As indicated in table 2, the estimates for 12 SMSA's are based on 1973 OMB boundary definitions and are not comparable with data for earlier years. (See appendix B for geographic boundary definitions.)

Wisconsin	2,082	94	4.5

[1]Estimates for this State or area were derived from data drawn from the Current Population Survey and the unemployment insurance program. A description of the statistical methods used to derive these estimates is in appendix C.

Modifications to estimation procedures

In 1972, the Bureau of Labor Statistics was assigned the responsibility for improving the statistical procedures which were being used by State employment security agencies to develop estimates of State and local unemployment rates. BLS introduced changes designed to establish a uniform concept of unemployment in all States and areas which would be consistent with the definitions used in the survey to measure unemployment at the national level.

The major thrust of the improvements implemented by BLS has been in two areas: (1) modifying the methodology previously used by States and areas to estimate unemployment; and (2) benchmarking State-prepared estimates to annual average totals from the Current Population Survey (CPS). The basic modifications in methodology are discussed in appendix A.

In regard to benchmarking, the standard used by BLS to determine whether annual average labor force estimates from the CPS for a given area can be used directly for benchmarking purposes is quite specific. The unemployment estimate for that area must have a relative error (standard error divided by sample estimate) of 10 percent or less at 1 standard error, assuming an unemployment rate of 6 percent. This means that, if repeated samples were drawn in that area using identical procedures, the true unemployment level would be contained in a 10-percent interval about the sample estimate in 68 percent of all possible sample intervals. The benchmark correction process is outlined below.

Benchmark Correction and Extrapolation Procedures. Each year the monthly employment and unemployment estimates developed by the State employment security agencies (SESA's) for the large States and metropolitan areas are adjusted to conform with the annual average estimates resulting from the CPS for those areas. The SESA estimates are based on statistics from the State Unemployment Insurance (UI) system, using a standardized formula (Handbook Method) developed many years ago by the Department of Labor. This method was designed to derive monthly estimates of employment and unemployment for

[1]All LMA's except three are coterminous with SMSA's. The three LMA's are indicated by footnote 4. Geographic boundary definitions for all LMA's are provided in appendix B.

[2]The estimates for this LMA are based on 1973 boundary definitions and are not comparable with data for earlier years.

[3]See footnote 1, table 1.

[4]The boundary definition for this SMSA differs from the boundary definition used by the Department of Labor in the CETA program.

an area that would have resulted if a sample survey of households had been conducted, using the same concepts and definitions as are used in the official government measures based on the CPS. However, due to differences in State UI laws, the structural limitations of the Handbook Method, and measurement errors in the UI inputs, the Handbook estimates are not as reliable for large States and areas as the CPS estimates. As a consequence, the annual average CPS labor force estimates are used to correct the UI–based monthly Handbook estimates.

The benchmarked estimates are produced in three phases. First, the monthly Handbook estimates for each State and area are adjusted by the ratio of the CPS and Handbook annual averages. Second, the difference between the ratio of annual averages for two consecutive years is wedged into the monthly estimates in order to minimize the disturbance to the original series. Finally, the preliminary benchmarked estimates are forced into agreement with the CPS annual averages.

In the current year, the benchmarked estimates are extrapolated by applying the latest relevant correction factor to the current Handbook estimates of employment and unemployment. The employment factor used in year (t) is the quotient of the December employment benchmarked and Handbook estimates in year (t-1). The unemployment factor for year (t) is the algebraic difference between the December unemployment benchmarked and Handbook estimates in year (t-1). The preliminary benchmarked estimate in the current year is then the result of applying the correction factor by multiplication (for employment), or by addition (for unemployment) to the current Handbook estimate.

Section II. Demographic and Occupational Estimates

Demographic data

Tables 3 and 4 contain detailed demographic data for 25 States and 28 SMSA's. In 1973, the BLS published data for 19 States and 30 SMSA's. This year, because of an improvement by the Bureau of the Census in the method used to inflate State sample estimates, the BLS is able to publish estimates for additional States. The 1974 annual average CPS total estimates for Illinois, Chicago, Michigan, and Detroit were not considered accurate enough by BLS for use in the CETA program; hence detailed estimates for these areas are not published. (See appendix C.)

The amount of detail published for States and metropolitan areas is determined to a large extent by the statistical quality of the estimates. In line with previous geographic reports, estimates for a specific subgroup are not published if the civilian labor force is less than 50,000. Since the error varies inversely with the size of the area and the size of the estimate, data for small areas and for subgroups constituting a small proportion of the total labor force are not published. BLS did not publish estimates for central cities in the *Geographic Profile* because data for many subgroups do not meet this standard.

Occupational data

Tables 5 and 6 contain percent distributions of total employment by occupational categories for 25 States and 28 SMSA's. This is the first time BLS has published occupational detail for States. Occupational detail for SMSA's published by BLS for 1970 in *Occupational Characteristics of Urban Workers, 1970* (Special Labor Force Report No. 138) are not comparable with current occupational detail due to changes in the occupational titles. The titles used in this edition are consistent with the new occupational titles introduced in the 1970 census and first published in the national CPS estimates in 1972. For more detailed information, see appendix D.

Standard error tables

Standard error tables appear in appendix E. These have been provided to enable users to evaluate each sample estimate. The BLS suggests that all users consult these tables before developing any comparative analyses. In some cases, users will discover that an apparent change in a statistic (or difference between two statistics) will prove to be insignificant when the relative error of an estimate is considered.

[1]Not strictly comparable with estimates for prior years due to revisions in the occupational classification system. For explanation of these changes, see appendix B.

[2]Estimates for this SMSA are based on 1973 boundary definitions of the Office of Management and Budget and are not comparable with data for earlier years.

NOTE: Dash indicates less than 0.05 percent.

Appendix A. Revised Procedures for Estimating Employment and Unemployment for States and Areas

Under a Federal–State cooperative program of the U.S. Department of Labor, State employment security agencies (SESA's) have developed estimates of employment and unemployment for States, labor areas, cities, and counties for a number of years. The Employment and Training Administration (formerly the Manpower Administration) uses these data for apportioning Federal funds for local program purposes. In the past, these estimates were totally independent of–and often differed substantially from–the estimates for the same areas derived from the Current Population Survey (CPS). These differences primarily reflected differences in the conceptual and methodological framework of the two programs. In November 1972, the Bureau of Labor Statistics was assigned responsibility for revising the concepts and methods utilized in preparing such estimates. After extensive research and consultation with other Federal and State agencies, new technical procedures were introduced late in 1973. These procedures were designed to produce State and area estimates which are consistent with the concepts and definitions used to measure labor force, employed, and unemployed at the national level. A review of the most important changes is provided below.

Employment

The procedure for estimating total employment by area has been substantially revised. Under the new procedure, the total employment estimates are on a "persons-by-place-of-residence" basis. Under the old procedure, a large share of the total employment estimate for a given State or area was on a "jobs-by-place-of-work" basis. There are two important reasons for this change. First, all other things being equal, the count of jobs will exceed the count of employed persons because some workers are on more than one payroll record during a given survey period–for example, nationally, about 5 percent of all employed workers hold more than one job. Second, the change to a place-of-residence rather than a place-of-work basis, while not affecting State totals appreciably, can modify estimates in most substate areas where there is substantial commuting to work–either into or out of the area. The effect of this change is to raise the employment estimate in the area where people reside and lower the estimate in the area where people work–if there is substantial commuting between these areas. Several other changes in the procedure will result in changes in the estimates of agricultural employment, self-employment, and employment of domestics. On an annual basis, data for States and large metropolitan areas are benchmarked to estimates for the same areas drawn from the Current Population Survey.

The concept and method of estimating total employment has been changed from place of work to place of residence. However, the definitions and procedures of estimating nonagricultural wage and salary employment by industry–the count of payroll jobs by place of work–remain exactly the same as in the past.

Unemployment

Unemployment estimates computed by State employment security agencies are developed by following a building block approach, which uses data from a variety of administrative and survey sources. The major source of data is a count of the insured unemployed derived from the administrative records of the State unemployment insurance (UI) system. Because UI laws and administrative regulations vary from State to State, differences in the levels of insured unemployment between States may not necessarily correlate with differences in total unemployment. Although an attempt is made to reconcile these differences, empirical evidence indicates that the estimates of total unemployment for States still reflect differences in the eligibility provisions of State UI laws. To minimize these distortions, the building block estimates are benchmarked to estimates from the national survey wherever possible. For 1973 this involved 19 States and 30 SMSA's. During 1974 and 1975, the number of States that were benchmarked was increased to 27. Supplementation to the CPS sample in other States was begun in mid-1975 in order to increase the reliability of the annual average estimates and thus enable BLS to benchmark estimates for all 50 States in 1977.

Labor force

Under the new procedure, the work force concept, based largely on a count of jobs by place of work, has been replaced with a labor force concept. Labor force estimates are the sum of employed and unemployed persons by place of residence. In general, the labor force estimate for an area will differ from the work force estimate, with the differ-

ence reflecting the adjustments to remove the effects of both multiple jobholding and commuting.

Unemployment rate

The total unemployment rate is the ratio of the number of unemployed to the total labor force. Under the revised methodology, unemployment rates for most areas will differ from those prepared by following the old procedure, with the largest modifications in areas where there is substantial commuting to work—either into or out of the area. The adjustment for commutation provides unemployment rate estimates that are much more comparable from area to area.

Appendix B. Metropolitan Area Geographic Definitions

This appendix lists the geographical boundary definitions of the 30 largest metropolitan areas used by the Department of Labor in the CETA program. For the Nation as a whole, nearly all of these metropolitan areas, called Labor Market Areas (LMA's), are coterminous with Standard Metropolitan Statistical Areas (SMSA's), designated and defined by the Office of Management and Budget (OMB). Annual average estimates for these areas are based directly on the Current Population Survey (CPS). In the New York, Minneapolis-St. Paul, and Denver–Boulder SMSA's, however, the CPS estimates must be adjusted to reflect the difference in area definitions of the LMA and SMSA. Table 2 contains the LMA estimates, while table 4 contains the SMSA estimates. Detailed estimates for LMA's have not been developed.

In general, each SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are comprised of cities and towns, the minimum population size is 75,000 inhabitants. OMB occasionally revises the SMSA geographic definitions. In 1973, the definitions of 12 SMSA's used in the CETA program were revised. The definitions for these SMSA's, plus the current definitions of the remaining 18 metropolitan areas, including LMA's, are listed alphabetically in table B-1.

When OMB revises the geographic definition of a given SMSA, the Bureau of the Census must revise the CPS sample for that area in order to produce consistent estimates. This revision creates a break in the time series for that area. Estimates based on revised boundary definitions were introduced in 1973 for the New York and Los Angeles SMSA's and, in 1974, for the 12 SMSA's referred to above.

Table B-1. Geographic boundaries of metropolitan areas used in CETA program

Area	CPS area 1970 definition[1]	CPS area 1973 definition[2]	LMA definition[3]
Anaheim-Santa Ana-Garden Grove	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Dupage, Kane, Lake, McHenry, Will	Same	Same

Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri Portion: Counties of Cass, Clay, Jackson, Platte Kansas Portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same

Table B-1. Geographic boundaries of metropolitan areas used in CETA program—Continued

Area	CPS area 1970 definition[1]	CPS area 1973 definition[2]	LMA definition[3]
Minneapolis-St. Paul	Minnesota Portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same
New York	New York Portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania Portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey Portion: Counties of Burlington, Camden, Gloucester.	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri Portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois Portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	D.C. Virginia Portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland Portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County,	1973 definition

[1]1970 area definitions were implemented by the Office of Management and Budget (OMB) during the period 1970–73.

[2]1973 area definitions were implemented by OMB in 1974.

[3]A Labor Market Area (LMA) is defined by the Department of Labor for program purposes. In many metropolitan areas, the LMA and SMSA are coterminous.

Appendix C. Statistical Outlier Procedure

An outlier is a statistical term for an atypical sample estimate which falls outside the established range of a probability distribution. For the Current Population Survey (CPS), it suggests that a sample of households, selected at random to represent all of the households in the universe in a given area, may in fact not be representative. The probability distribution of the CPS is defined in terms of the standard error of the estimate. In 95 cases out of 100, we can be confident that the "true" unemployment rate will fall within 2 standard errors of the estimate. In other words, in 5 cases out of 100, the difference between the "true" unemployment rate and the CPS estimate could be greater than twice the standard error. Those CPS estimates which fall outside established confidence limits for sampling and nonsampling errors are designated as outliers.

Based on the 95-percent confidence limit for reliability, we could expect about 3 outliers each year for the 57 CPS sample areas for which 1974 data are available (27 States and 30 SMSA's). However, it is not possible to use the CPS probability distribution by itself to detect outliers unless a complete census were taken at the same time. This section describes an objective test which has been developed to detect an outlier, and the procedure that is used for adjusting the outlying CPS estimate.

The procedure is based on the assumption that the annual changes in the Handbook-derived unemployment rates (ΔH) and the CPS unemployment rates (ΔC) reflect the same economic trends. If so, then the expected difference between the two series ($\Delta H - \Delta C$) should be zero.[1] With this assumption, we can test the null hypothesis that the observed difference ($\Delta H - \Delta C$) is not significantly different from zero by comparing the observed difference to twice the standard deviation ($\Delta H - \Delta C$).[2]

To apply the t-test in this situation, one needs to know the standard error of (ΔC) and the standard deviation of (ΔH). Since the CPS is based on a probability sample, the Bureau of the Census has estimated the standard error of (ΔC). The Handbook estimates, however, are not based on a sample survey, yet other types of errors such as recording errors, estimation errors (exhaustees, entrants, etc.) do occur. We can derive an appropriate standard deviation[3] for (ΔH) as follows:

Let:
- (ΔH) = Annual change in Handbook-derived unemployment rate
- (ΔC) = Annual change in CPS unemployment rate
- (ΔU) = Annual change in "true" unemployment rate
- (SE) = Standard error of (ΔC)
- (SD) = Standard deviation of (ΔH)
- E = Expected value

Then:

1. $E(\Delta H - \Delta C)^2 = E(\Delta H - \Delta U)^2 + E(\Delta C - \Delta U)^2$ [4]

and:

2. $E(\Delta C - \Delta U)^2 = E(\Delta C^2) - (\Delta U^2)$
3. $E(\Delta H - \Delta U)^2 = E(\Delta H^2) - (\Delta U^2)$

If we assume: $(\Delta U^2) = 0$;

Then:

4. $E(\Delta C - \Delta U)^2 = E(\Delta C^2) = (SE)^2$
5. $E(\Delta H - \Delta U)^2 = E(\Delta H^2) = (SD)^2$

and:

6. $E(\Delta H - \Delta C)^2 = (SE)^2 + (SD)^2$.

We do not know the change in the true unemployment rate; hence we will assume that $(\Delta U)^2 = 0$ if we can identify two successive years in which the change in the national CPS rate was not significant. For 1968-1969, (ΔC) = 0.07 percent; hence, from equation 5, the expected value of (ΔH) is assumed equal to $(SD)^2$.[5] To compute $(SD)^2$, it was necessary to pool data for the CPS States and SMSA's. The estimated variance, $(SD)^2$, for the 10 largest States equaled 0.031; for the 20 SMSA's it also equaled 0.031. This suggested that the empiric standard deviation derived by pooling area data is a good approximation of the expected standard deviation of the change in the Handbook estimate for any large area.[6] This conclusion did not seem unreasonable since all States and areas used the same methodology and errors cannot be associated necessarily with the size of the area of geographic location. This contrasts with the standard error of the CPS which varies inversely with the size of the sample and the size of the estimate.

Using equation 6, the expected variance $E(\Delta H - \Delta C)^2$ was derived for each area. The test compared the observed difference ($\Delta H - \Delta C$) with a multiple of its standard deviation.[7] To be identified as an outlier an area had to meet one of two tests. (1) The observed difference had to be greater than three times its standard deviation, or (2) the observed difference was greater that two times its standard deviation and differed significantly in direction from the insured unemployment rate.[8] A three sigma test was used as a first screening test rather than a two sigma test because in some areas the value of the standard deviation of ($\Delta H - \Delta C$) is underestimated when (ΔC) does not equal zero. In 1970-1971 for example when ΔC=0.99 percent, 9 outliers (out of a total of 30 areas) would have been identified. This is clearly too large a number for 1 year and could not be supported by any probability distribution considerations.

After identifying the outlier, the original CPS estimate is adjusted using a composite estimating procedure where (ΔC) and (ΔH) are weighted by the inverse of their

variances.[9] For 1974, two outliers were detected, Detroit and Chicago. However, the CPS estimates for the States of Michigan and Illinois were also adjusted because they are dependent on the estimates for the major areas. The mathematics of the adjustment for Chicago are given below:

A. Test for outlier status:

Step 1: Determine the observed difference between the year-to-year change in the CPS and Handbook unemployment rates.

Table C–1.

Chicago	1973	1974	Change
Handbook (H)	3.6	4.2	+0.6
CPS (C) *	4.2	4.0	−0.2
Observed difference			0.8

*Original sample estimates

Step 2: Calculate root mean square error of the difference in the change in the rates.

$(SE) = S_1^2 = 0.058$

$(SD) = S_2^2 = 0.031$

$S = \sqrt{S_1^2 + S_2^2} = \sqrt{0.0886} = 0.298$

$2S = 0.595$
$3S = 0.893$

Step 3: Compare the observed difference to 3 times the expected error of the difference. (See table C–1)

$(\Delta H - \Delta C) = 0.6 - (-0.2) = 0.8$

first test: $3S > 0.8$
second test: $2S < 0.8$

The observed difference fails the first test, but passes the second test (i.e. is an outlier) because the CPS rate declined over the year, while the insured rate increased.

B. Adjustment to CPS estimates:

Step 1: Determine the observed difference between the year-to-year change in the CPS and Handbook unemployment levels.

Table C–2.

Chicago	(H)	Change	(C)*	Change
1972	135		155	
1973	109	−26	130	−25
1974	129	20	126	− 4

*Original sample estimates

Step 2: Compute adjusted change in CPS estimates from 1973 to 1974 using the inverse of the variances:

$$\text{Change} = \Delta C' = \frac{(-4 \times 0.031 + 20 \times 0.058)}{0.0886} - 12$$

Step 3: Determine reference year using unemployment levels.
(a) Substitute adjusted change in 1974; revise 1973 CPS level to agree with the adjusted change; compute mean square difference:

Table C-3.

Chicago	(H)	Change	(C)	Change	Squared difference
1972	135		155		
1973	109	−26	114	−41	225
1974	129	20	126	12	64
Sum					289

(b) Substitute adjusted change in 1973; revise 1974 CPS level to agree with the adjusted change; compute mean square difference:

Table C-4.

Chicago	(H)	Change	(C)	Change	Squared difference
1972	135		155		
1973	109	−26	130	−25	1
1974	129	20	142	12	64
Sum					65

Compare mean square difference. Since the mean square difference in (b) is less than in (a), then 1974 is considered the reference year. Hence the 1974 unemployment level for Chicago is revised upwards from 126 to 142.

Table C-5.

–FOOTNOTES–

[1] If (ΔH) and (ΔC) are two independent random variables with the same mean and different variances, (SD_1^2) and (SD_2^2), then the distribution of the observed difference, $(\Delta H - \Delta C)$, will have a mean of zero and a variance equal to $(SD_1^2 + SD_2^2)$.

[2] This is the usual t-test at the five-point level of significance.

[3] In this context the standard deviation is derived from a hypothetical distribution whose mean is equal to the average Handbook-based unemployment rate estimate.

[4] Since (ΔH) and (ΔC) are independent, there is no covariance term.

[5] For 1968-1969, $\Delta C = 0.07$, hence, $\Delta C^2 = 0.0049$ percent (which is not significantly different from zero).

[6] This is an appropriate assumption only if the bias is equal in all areas.

[7] This is the usual test for two proportions, variances known:

$$t = \frac{(\Delta H - \Delta C) - 0}{\sqrt{(SD)^2 + (SE)^2}}$$

Changes in unemployment rates were used because earlier tests showed that there is a high probability that the Handbook estimate for a single year may be biased. In 1972 for example, the difference in the levels was significant, at two sigma, for 7 of the 10 States. However, (ΔC) and (ΔH) for 1971-1972 were significantly different in only two States.

[8] A change of 0.3 for the insured unemployment rate was used because it is equal to approximately two times its standard deviation.

[9] Expressed mathematically:

$$\Delta C' = \frac{[\Delta C(SD)^2 + \Delta H(SE)^2]}{[(SD)^2 + (SE)^2]}, \text{ where}$$

ΔC = change in CPS unemployment level and

ΔH = change in Handbook unemployment level

Appendix D. Changes in Occupational Classification System

Beginning with 1971, the comparability of occupational employment data was affected as a result of changes in census occupational classifications introduced into the Current Population Survey (CPS). These changes stemmed from an exhaustive review of the classification system to be used for the 1970 Census of Population. This review, the most comprehensive since the 1940 census, aimed to reduce the size of large groups, to be more specific about general and "not elsewhere classified" groups, and to provide information on significant emerging occupations. Differences in March 1970 employment levels tabulated on both the 1960 and 1970 classification systems ranged from a drop of 650,000 in operatives to an increase of 570,000 in service workers, much of which resulted from a shift between these two groups; the nonfarm laborers group increased by 420,000, and changes in other groups amounted to 220,000 or less.

An additional major group was created by splitting the operatives category into operatives, except transport, and transport equipment operatives. Separate data for these two groups first became available in January 1972. At the same time, several changes in titles, as well as in order of presentation, were introduced; for example, the title of the managers, officials, and proprietors group was changed to "managers and administrators, except farm," since only proprietors performing managerial duties are included in the category.

Apart from the effects of revisions in the occupational classification system beginning in 1971, comparability of occupational employment data was further affected in December 1971, when a question eliciting information on major activities or duties was added to the monthly CPS questionnaire in order to determine more precisely the occupational classification of individuals. This change resulted in several dramatic occupational shifts, particularly from managers and administrators to other groups. Thus, meaningful comparisons of occupational levels cannot be made between 1972 and prior periods. However, revisions in the occupational classification system as well as in the CPS questionnaire are believed to have had but a negligible impact on unemployment rates.

Additional information on changes in the occupational classification system of the CPS appears in "Revisions in Occupational Classifications for 1971" and "Revisions in the Current Population Survey" in the February 1971 and February 1972 issues, respectively, of *Employment and Earnings*.

Appendix E. Standard Error Tables

The State and SMSA estimates appearing in this report are based on a random sample of households, instead of a complete census of the population. As a consequence, the sample estimates are subject to sampling (as well as nonsampling) errors. In general, the error of a sample estimate varies inversely with the size of the sample and the size of the estimate. Hence an estimate for a small area, or for a subgroup constituting a small proportion of the population, will tend to have a relatively higher error than an estimate for a large area or for a subgroup constituting a relatively large proportion of the population. Standard error tables make it possible to compute the relative error (standard error divided by estimate size) of a sample estimate, and to compare two sample estimates using a standard statistical test of significance. This appendix contains a detailed set of standard error tables for totals and proportions, by individual State and for SMSA's as a group.

The standard errors in these tables can be used directly to develop 68-percent confidence intervals for sample estimates. Standard errors for 90-percent confidence intervals can be computed by multiplying the standard errors in these tables by 1.65. For 95-percent confidence intervals, use 1.96.

The standard error tables in this publication should *not* be used with sample estimates appearing in earlier *Geographic Profile* reports. In 1973, the Bureau of the Census introduced a new procedure for inflating sample estimates on a State basis. The effect of this procedure was to improve the estimates of employment and unemployment at the State level. Therefore, State estimates in earlier years will generally be subject to a wider range of error. Standard errors of estimates for earlier years appear in the relevant *Geographic Profile* report.

Preface

This report is the latest in a series presenting geographic labor force data from the Current Population Survey (CPS). It provides 1975 annual averages for large States and large metropolitan areas. Data for previous years may be found in the following articles and reports: *Characteristics of Workers in Large States and SMSA's–1970* (BLS Report 388); *Employment in Perspective: Regional Aspects of Unemployment, 1969-70* (BLS Report 395); *Geographic Profile of Employment and Unemployment, 1971* (BLS Report 402); *1972* (BLS Report 421); *1973* (BLS Report 431); *1974* (BLS Report 452); and "Regional Differences in Employment and Unemployment, 1957-72" (*Monthly Labor Review*, March 1974).

Material in this publication is in the public domain and may be reproduced without the permission of the Federal Government. Please credit the Bureau of Labor Statistics and cite the name and number of the publication.

This report was prepared in the Office of Employment Structure and Trends, Division of Local Area Unemployment Statistics, by Fred Cronkhite, Richard Rosen, and Sylvia Small.

E. Standard Error Tables 44

Introduction

This report is divided into two sections. Section I presents 1975 annual average labor force and unemployment estimates for 27 large States and 30 large Labor Market Areas (LMA's) used by the Department of Labor in administering various Federal economic assistance programs such as the Comprehensive Employment and Training Act (CETA). These estimates are based, either directly or indirectly, on the Current Population Survey (CPS). Under the requirements of Circular A-46 issued by the Office of Management and Budget in December 1975, the Bureau of Labor Statistics is responsible for publishing State and area labor force and unemployment estimates used for Federal program purposes.

Section II presents 1975 annual average estimates of the labor force, employment and unemployment in demographic detail for 26 large States, 29 large Standard Metropolitan Statistical Areas (SMSA's), and 10 central cities based directly on the CPS. For the first time, tables are included showing occupational characteristics by sex and race for selected States and areas. Tables showing duration of unemployment and full- or part-time status of the labor force also are included for these States and areas.

In a few instances, 1975 estimates for the metropolitan areas in Section II differ from those in Section I. This is the result of differences between the geographic definition of the LMA's determined by the Department of Labor and used for program purposes, and those of the SMSA's determined by the Office of Management and Budget and used by the Census Bureau in conducting the CPS. Geographic boundary definitions of the 30 largest SMSA's are compared with those for the corresponding LMA's in appendix B.

Section I. Total Labor Force and Unemployment Estimates for Large States and Large Labor Market Areas

Table 1 presents annual average estimates for 27 large States, and table 2 provides corresponding estimates for 30 large Labor Market Areas used in 1976 to administer various Federal economic assistance programs. The tables are compiled from the Current Population Survey (CPS), and include adjustments necessitated by differences between SMSA boundaries and Labor Market Area (LMA) definitions, and synthetic estimates which result from the "outlier" adjustment.

Table 1. Labor force and unemployment estimates for 27 States, 1975 annual averages

(Numbers in thousands)

State	Civilian labor force	Unemployment	
		Level	Rate
Alabama	1,440	111	7.7
California	9,380	925	9.9
Connecticut	1,453	133	9.1
Florida	3,472	370	10.7
Georgia	2,143	185	8.6
Illinois	4,997	355	7.1

Washington, D.C.[2]	1,434	79	5.5

[1] All except 3 LMA's were conterminous with SMSA's—Denver-Boulder, Minneapolis-St. Paul, and New York. Geographic boundaries of the 30 LMA's are provided in appendix B.

[2] Estimates for this area are based on 1973 boundaries as defined by Office of Management and Budget and are not comparable with data prior to 1974.

[3] The 1975 estimates for this area were derived from data drawn from the Current Population Survey and the unemployment insurance program. A description of the statistical methods used to derive these estimates is provided in appendix C.

Estimation procedures

In 1972, the Bureau of Labor Statistics (BLS) was given the responsibility for improving the unemployment estimates generated by State employment security agencies (SESA's). BLS has introduced changes in methodology designed to establish a uniform concept of unemployment in all States and areas which would be consistent with definitions used to measure unemployment at the national level. For a number of years, State employment security offices, using a standardized formula (*Handbook* method) developed by the Department of Labor, prepared estimates of employment and unemployment based on statistics from the unemployment insurance (UI) system.

This method is designed to derive monthly estimates of employment and unemployment for an area similar to those that would have resulted if a sample survey of households had been conducted, using the same concepts and definitions as are used in the official government measures based on the CPS. However, due to differences in State UI laws, the structural limitations of the *Handbook* method, and measurement errors in the UI inputs, *Handbook* estimates are considered less reliable for large States and areas than CPS estimates. As a consequence, annual average CPS labor force estimates are used to correct UI-based monthly *Handbook* estimates. Before the estimating procedure was revised, State and area estimates prepared by SESA's were totally independent of–and usually different from–estimates for the same area from the CPS. A more detailed description of the estimating process can be found in appendix A.

Special adjustments

In 1975, State-prepared estimates for 26 States and 26 LMA's were benchmarked directly to the CPS annual averages. Estimates for St. Louis and Missouri, using the outlier adjustment procedure, were based on a combination of CPS and *Handbook* estimates (appendix C). In addition, the CPS estimates for three SMSA's (New York, Minneapolis-St. Paul, and Denver-Boulder) were adjusted to conform to the LMA boundary.

Section II. Detailed Demographic Labor Force Estimates for Large States and Large Standard Metropolitan Statistical Areas

The data in this section are annual averages based on the Current Population Survey (CPS), a survey of nearly 47,000 households, conducted monthly by the Bureau of the Census for the BLS. Estimates are presented for 26 large States, 29 SMSA's, and 10 central cities. Since the 1975 annual average CPS estimates for Missouri and the St. Louis SMSA are not considered reliable for program purposes, detailed estimates have not been published.

Labor force by sex and race

Tables 3 and 4 contain demographic data for 26 States, 29 SMSA's, and 10 central cities. Estimates of the total labor force are shown separately for white workers and, whenever possible, for black and other workers, by sex and by selected age groups. Only groups with a labor force estimate of 50,000 or more are shown separately.

Unemployment by duration

For the first time, the BLS is publishing data showing unemployed persons by duration of unemployment in States and large SMSA's. In tables 5 and 6, the proportion of unemployed by the length of the period of unemployment is shown for States and areas.

The number in the labor force by full- or part-time status is presented in tables 7 and 8. Such data were published earlier–by region in 1972, and by State in 1973.

Occupational distribution of employment

In tables 9 and 10, employment distribution by major occupation is shown for selected States and areas. Occupational distributions, first published in the 1974 edition of this report, are expanded to include distributions by sex and by race. Data appearing in an earlier BLS report, *Occupational Characteristics of Urban Workers, 1970* (Special Labor Force Report 138) are not strictly comparable because of changes in occupational definitions. Occupational classifications used in this and the preceding edition are consistent with the new occupational definitions introduced in the 1970 Census and first published in the national CPS estimates in 1972. Changes in occupational classifications are discussed in appendix D.

Reliability of estimates

The amount of detail published for States and metropolitan areas is determined to a large extent by the statistical quality of the estimates. In line with previous geographic reports, estimates for a specific subgroup are not published if the civilian labor force is less than 50,000. As indicated in appendix E, the error varies inversely with the size of the area and the size of the estimate. Consequently, data for small areas or small subgroups are less reliable. Standard error tables in appendix E have been provided to enable users to evaluate the statistical reliability of each sample estimate. The Bureau suggests that users consult these tables before developing any comparative analyses, since in some cases an apparent change in a statistic (or difference between two statistics) will prove insignificant when its relative error is considered.

Table 3. Labor force status of the civilian noninstitutional population 16 years and over in 26 large States, by sex, age, and race, 1975 annual averages

(Numbers in thousands)

State and population group	Civilian noninstitutional population	Civilian labor force		Employment	Unemployment

[2] Less than 0.05 percent.

NOTE: Individual items may not add to 100 percent due to rounding.

Appendix A. Procedures for Estimating Employment and Unemployment for States and Areas

Federal-State cooperative program

Labor force and unemployment estimates for States, Labor Market Areas (LMA's), and other areas specifically defined for fund allocation purposes are developed under a Federal-State cooperative program and transmitted each month to BLS. Local unemployment estimates approved by BLS are the basis for determining eligibility of an area for benefits under Federal economic assistance programs such as those established by the Comprehensive Employment and Training Act (CETA).

Since November 1972, the BLS has been responsible for developing the concepts and methods used by State employment security agencies to estimate State and local area labor force, employment, and unemployment. In December 1975, the Office of Management and Budget extended this responsibility to include the publication of such estimates. Earlier, State agencies had prepared estimates using a method developed by the Department of Labor in the 1950's, generally referred to as the *Handbook* method (BES Report No. R-185). The new system combines the *Handbook* method with adjustments based on the concepts and definitions used in the national Current Population Survey (CPS).

Preliminary estimate—employment

Under the new system, total employment estimates are on a "persons by place of residence" basis rather than on a "jobs by place of work" basis. Using relationships which existed at the time of the 1970 Decennial Census, adjustment factors for major categories of employment by class of worker and industry have been developed. These factors are applied to the payroll employment estimates for the current period to obtain an adjusted employment figure which is incorporated into the *Handbook* estimate.

Although not affecting State totals appreciably, the change can modify estimates in substate areas where commuting to work is substantial—by raising the employment estimate in areas where people reside, and lowering it in areas where they work. The change may raise or lower the unemployment rate.

Although the concept of employment has changed from place of work to place of residence, definitions and procedures for estimating nonagricultural wage and salary employment by industry—the count of payroll jobs by place of work—remain exactly the same.

Preliminary estimate—unemployment

Unemployment estimates computed by State employment security agencies are developed by following a building block approach, which uses data from a variety of administrative and survey sources. Unemployment is an aggregate of estimates for each of three building block categories: (1) Persons who were previously employed in industries covered by State unemployment insurance (UI) laws; (2) those previously employed in industries not covered by these laws; and (3) those who were either entering the labor force for the first time or reentering after a period of separation.

Those previously employed in covered industries are derived from counts of: (1) current unemployment insurance claimants, and (2) persons disqualified from receiving benefits for nonmonetary reasons (because they quit, were discharged for cause, etc., but otherwise would have been eligible); and estimates of: (3) claimants whose benefits have been exhausted and (4) persons who either filed claims late or did not file.

Unemployment in industries not covered by UI is estimated from the current ratio of covered unemployment to covered employment, applied to the employment estimate for each industry or class of worker subgroup in the State, weighted by factors reflecting national historical relationships between covered and noncovered industries.

For the third category, new entrants and reentrants into the labor force, a composite estimate is developed from equations that relate total entrants into the labor force to the experienced labor force and experienced unemployed.

Because UI laws and administrative regulations vary from State to State, differences in the levels of insured unemployment between States may not necessarily correlate with differences in total unemployment. Although an attempt is made to reconcile these differences, evidence indicates that estimates of total unemployment for States still reflect differences in the eligibility provisions of State UI laws. Consequently, annual data from the CPS are used to correct the State-prepared estimates.

Benchmark correction and extrapolation procedures

Once each year BLS adjusts or benchmarks all monthly estimates prepared by State Employment Security Agencies under the *Handbook* method to annual average estimates resulting from the CPS. This adjustment is necessary because the State-prepared estimates are less reliable than CPS estimates due to differences in State UI laws, structural limitations of the *Handbook* method, and errors in the UI data.

The criterion used by BLS to determine whether annual average labor force estimates from the CPS for a given area can be used directly for benchmarking purposes is quite specific. With a 6-percent unemployment rate, the unemployment estimates for that area must have a relative error (standard error divided by sample estimate) of 10 percent or less at 1 standard error. If repeated samples, using identical procedures, were drawn in that area, the true unemployment level would be contained in a 10-percent interval around the sample estimate 68 percent of the time. The method for the benchmark correction process is outlined below. In 1973, 19 States and 30 SMSA's met this criterion. During 1974 and 1975, the number of States that were benchmarked using CPS sample estimates for the State increased to 27. In 1975, SESA estimates in 23 smaller States were adjusted, on the basis of the aggregate CPS estimates for those States, to produce consistent unemployment estimates in all States. Supplementation to the CPS in these 23 States was begun in mid-1975 to increase the reliability of the annual average CPS estimates.

Benchmarked estimates are produced in three stages. First, the monthly *Handbook* estimates are adjusted by the ratio of the CPS and *Handbook* annual averages. Second, the difference between the ratio of annual averages for 2 consecutive years is wedged into the monthly estimates to minimize the disturbance to the original series. Finally, second-stage estimates are forced to agree with CPS annual averages.

Benchmarked estimates are extrapolated into the current year by applying the latest relevant correction factor to the current *Handbook* estimates of employment and unemployment. The employment factor used in year (t) is the quotient of the December employment benchmark and *Handbook* estimates in year (t-1). The unemployment factor for year (t) is the algebraic difference between the December unemployment benchmark and *Handbook* estimates in year (t-1). The preliminary estimate in the current year is then the result of applying the correction factor by multiplication (for employment), or by addition (for unemployment) to the current *Handbook* estimate.

Appendix B. Geographic Boundary Definitions for 30 Largest Metropolitan Areas (Labor Market Areas and Standard Metropolitan Statistical Areas)

This appendix lists the geographical boundary definitions of the 30 largest metropolitan areas designated by the Department of Labor. For the Nation as a whole, nearly all of these metropolitan areas, called Labor Market Areas (LMA's), are conterminous with Standard Metropolitan Statistical Areas (SMSA's), designated and defined by the Office of Management and Budget (OMB).

The Department of Labor has used Labor Market Areas for a number of years for various administrative and program purposes. Designed to measure conditions of the labor force within reasonable commuting distance of a large central city (or cities), the geographic boundaries for almost all LMA's are the same as those for SMSA's as defined by OMB. (See definition). OMB uses a set of uniform criteria to determine the geographic boundaries of SMSA's. By way of contrast, State Employment Security agencies and the Department of Labor jointly define LMA's. Since many LMA's were established before they were designated as an SMSA, a few areas with boundary differences reflect this initial classification discrepancy.

In this report, estimates for LMA's are based directly on the Current Population Survey (CPS), except in New York, Minneapolis-St. Paul, and Denver-Boulder, where the CPS estimates (based on the SMSA) must be adjusted to reflect the difference in area definitions of the LMA and SMSA. Estimates in Section I refer to LMA's, while estimates in Section II refer to SMSA's.

An SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are comprised of cities and towns, the minimum population size is 75,000. The OMB occasionally revises the SMSA geographic definitions. In 1973, the definitions of 12 of the 30 largest SMSA's were revised. Definitions for these SMSA's plus current definitions of the remaining 18 metropolitan areas, including LMA's, are listed alphabetically in table B-1.

When OMB revises the geographic definition of an SMSA, the Bureau of the Census must revise the CPS sample for that area to produce consistent estimates. This revision creates a break in the time series for that area. In 1973, estimates based on revised boundary definitions were introduced for the New York and Los Angeles SMSA's and, in 1974, for the 12 SMSA's already referred to. LMA boundaries are revised periodically and are published annually in the May issue of *Employment and Earnings.*

Table B-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	CPS area 1970 definition[1]	CPS area 1973 definition[2]	LMA definition[3]
Anaheim-Santa Ana-Garden Grove	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne, Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Dupage, Kane, Lake, McHenry, Will	Same	Same
Cincinnati	Ohio Portion: Counties of Clermont, Hamilton, Warren Kentucky Portion: Counties of Boone, Campbell, Kenton Indiana Portion: Dearborn County	Same	Same
Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Parker, Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri Portion: Counties of Cass, Clay, Jackson, Platte Kansas Portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same
Minneapolis-St. Paul	Minnesota Portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County

See footnotes at end of table.

Table B-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)—Continued

Area	CPS area 1970 definition[1]	CPS area 1973 definition[2]	LMA definition[3]
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same
New York	New York Portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania Portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey Portion: Counties of Burlington, Camden, Gloucester	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri Portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois Portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	D.C. Virginia Portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland Portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County	1973 definition

[1] 1970 area definitions were implemented by the Office of Management and Budget (OMB) during the period 1970-73.

[2] 1973 area definitions were implemented by OMB in 1974.

[3] A Labor Market Area (LMA) is defined by the Department of Labor for program purposes. In most metropolitan areas, the LMA and SMSA are conterminous.

Appendix C. Statistical Outlier Procedure

An outlier is a statistical term for an atypical sample estimate which falls outside the established range of a probability distribution. For the Current Population Survey (CPS), it suggests that a sample of households, selected at random to represent all of the households in the universe in a given area, may in fact not be representative. The probability distribution of the CPS is defined in terms of the standard error of the estimate. In 95 cases out of 100, we can be confident that the "true" unemployment rate will fall within 2 standard errors of the estimate. In other words, in 5 cases out of 100, the difference between the "true" unemployment rate and the CPS estimate could be greater than twice the standard error. Those CPS estimates which fall outside established confidence limits for sampling and nonsampling errors are designated as outliers.

Based on the 95-percent confidence limit for reliability, we could expect about 3 outliers each year for the 57 CPS sample areas for which 1975 data are available (27 States and 30 SMSA's). However, it is not possible to use the CPS probability distribution by itself to detect outliers unless a complete census is taken at the same time. This section describes an objective test which has been developed to detect an outlier, and the procedure that is used for adjusting the outlying CPS estimate.

The procedure is based on the assumption that the annual changes in the *Handbook*-derived unemployment rates (ΔH) and the CPS unemployment rates (ΔC) reflect the same economic trends. If so, then the expected difference between the two series ($\Delta H - \Delta C$) should be zero.[1] With this assumption, we can test the null hypothesis that the observed difference ($\Delta H - \Delta C$) is not significantly different from zero by comparing the observed difference to twice the standard deviation of ($\Delta H - \Delta C$).[2]

To apply the t-test in this situation, one needs to know the standard error of (ΔC) and the standard deviation of (ΔH). Since the CPS is based on a probability sample, the Bureau of the Census has estimated the standard error of (ΔC). The *Handbook* estimates are not based on a sample survey. However, other types of errors such as recording errors, estimation errors (exhaustees, entrants, etc.) do occur. We can derive an appropriate standard deviation[3] for (ΔH) as follows:

Let:

- (ΔH) = Annual change in *Handbook*-derived unemployment rate
- (ΔC) = Annual change in CPS unemployment rate
- (ΔU) = Annual change in "true" unemployment rate
- (SE) = Standard error of (ΔC)
- (SD) = Standard deviation of (ΔH)
- E = Expected value

Then:

$$1.\ E(\Delta H - \Delta C)^2 = E(\Delta H - \Delta U)^2 + E(\Delta C - \Delta U)^2 \qquad (4)$$

and:

$$2.\ E(\Delta C - \Delta U)^2 = E(\Delta C^2) - (\Delta U^2)$$

$$3.\ E(\Delta H - \Delta U)^2 = E(\Delta H^2) - (\Delta U^2)$$

If we assume: $(\Delta U^2) = 0$;

Then:

$$4.\ E(\Delta C - \Delta U)^2 = E(\Delta C^2) = (SE)^2$$

$$5.\ E(\Delta H - \Delta U)^2 = E(\Delta H^2) = (SD)^2$$

and:

$$6.\ E(\Delta H - \Delta C)^2 = (SE)^2 + (SD)^2.$$

We do not know the change in the true unemployment rate; hence we will assume that $(\Delta U)^2 = 0$ if we can identify two successive years in which the change in the national CPS rate was not significant. For 1968-1969, $(\Delta C) = 0.07$ percent; hence, from equation 5, the expected value of (ΔH) is assumed equal to $(SD)^2$.[5] To compute $(SD)^2$, it was necessary to pool data for the CPS States and SMSA's. The estimated variance, $(SD)^2$, for 27 large States equaled 0.079; for the 30 SMSA's it also equaled 0.079. This suggested that the empiric standard deviation derived by pooling area data is a good approximation of the expected standard deviation of the change in the *Handbook* estimate for any large area.[6] This conclusion did not seem unreasonable since all States and areas used the same methodology and errors cannot be associated necessarily with the size of the area of geographic location. This contrasts with the standard error of the CPS which varies inversely with the size of the sample and the size of the estimate.

Using equation 6, the expected variance $E(\Delta H - \Delta C)^2$ was derived for each area. The test compared the observed difference ($\Delta H - \Delta C$) with a multiple of its standard deviation.[7] To be identified as an outlier an area had to meet one of two tests. (1) The observed difference had to be greater than three times its standard deviation, or (2) the observed difference was over twice its standard deviation and differed significantly in direction from the change in the insured unemployment rate.[8] A three sigma test was used as a first screening test rather than a two sigma test because in some areas the value of the standard deviation of ($\Delta H - \Delta C$) is underestimated when (ΔC) does not equal zero. In 1970-1971 for example when $\Delta C = 0.99$ percent, 9 outliers (out of a total of 30 areas) would have been identified. This is clearly too large a number for 1 year and could not be supported by any probability distribution considerations.

After identifying the outlier, the original CPS estimate is adjusted using a composite estimating procedure where

(ΔC) and (ΔH) are weighted by the inverse of their variances[9]. For 1975, the only outlier detected was St. Louis. However, the CPS estimate for the State of Missouri was also adjusted because it depends on the estimate for this area. The mathematics of the adjustment for St. Louis are given below:

A. Test for outlier status:

Step 1: Determine the observed difference between the year-to-year change in the CPS and *Handbook* unemployment rates.

Table C-1

	1974	1975	Change
St. Louis			
Handbook (H)	5.7	8.6	+2.9
CPS (C)*	5.9	5.9	0.0
Observed difference			2.9

*Original sample estimates

Step 2: Calculate root mean square error of the difference in the change in the rates.

$(SE) = S_1^2 = 0.27$
$(SD) = S_2^2 = 0.079$
$S = \sqrt{S_1^2 + S_2^2} = \sqrt{0.35} = 0.59$
$2S = 1.2$
$3S = 1.8$

Step 3: Compare the observed difference to 3 times the expected error of the difference. (See table C-1)

$(\Delta H - \Delta C) = 2.9 - 0.0 = 2.9$
first test: $3S < 2.9$

The observed difference passes the test (i.e., it is an outlier).

B. Adjustment to CPS estimates:

Step 1: Determine the observed difference between the year-to-year change in the CPS and *Handbook* unemployment levels.

Table C-2

St. Louis	(H)	Change	(C)*	Change
1973	49		54	
1974	57	8	59	5
1975	86	29	59	0

*Original sample estimates

Step 2: Compute adjusted change in CPS estimates from 1974 to 1975 using the inverse of the variances:

$$\text{Change} = \Delta C = \frac{(29 \times 0.27 + 0 \times 0.079)}{0.27 + 0.079} = 22$$

Step 3: Determine reference year using unemployment levels. (a) Substitute adjusted change in 1975 (59 + 22 = 81); revise 1974 CPS level to agree with the adjusted change; compute mean square difference:

Table C-3a

St. Louis	(H)	Change	(C)	Change	Squared Difference
1973	49		54		
1974	57	8	59	5	9
1975	86	29	81	22	49
					58

mean square difference = 58 ÷ 2 = 29

(b) Substitute adjusted change in 1974 (59 - 22 = 37); revise 1975 CPS level to agree with the adjusted change; compute mean square difference:

Table C-3b

St. Louis	(H)	Change	(C)	Change	Squared Difference
1973	49		54		
1974	57	8	37	-17	625
1975	86	29	59	22	49
					674

mean square difference = 674 ÷ 2 = 337

(c) Compare mean square differences. Since the mean square difference in table C-3a is less than that in table C-3b, 1974 is considered the reference year. Hence, the 1975 unemployment level for St. Louis is revised upward from 59 to 81.

— *FOOTNOTES* —

[1] If (ΔH) and (ΔC) are two independent random variables with the same mean and different variances, (SD_1^2) and (SD_2^2), then the distribution of the observed difference, (ΔH - ΔC), will have a mean of zero and a variance equal to $(SD_1^2 + SD_2^2)$.

[2] This is the usual t-test at the five-point level of significance.

[3] In this context the standard deviation is derived from a hypothetical distribution whose mean is equal to the average *Handbook*-based unemployment rate estimate.

[4] Since (ΔH) and (ΔC) are independent, there is no covariance term.

[5] For 1968-1969, $\Delta C = 0.07$, hence, $\Delta C^2 = 0.0049$ percent (which is not significantly different from zero).

[6] This is an appropriate assumption only if the bias is equal in all areas.

[7] This is the usual test for two proportions, variances known:

$$t = \frac{(\Delta H - \Delta C) - 0)}{\sqrt{(SD)^2 + (SE)^2}}$$

Changes in unemployment rates were used because earlier tests showed that there is a high probability that the *Handbook* estimate for a single year may be biased. In 1972, for example, the difference in the levels was significant, at two sigma, for 7 of the 10 States. However, (ΔC) and (ΔH) for 1971-1972 were significantly different in only two States.

[8] A change of 0.3 for the insured unemployment rate was used because it is equal to approximately two times its standard deviation.

[9] Expressed mathematically:

$$\Delta C = \frac{[\Delta C(SD)^2 + \Delta H(SE)^2]}{[(SD)^2 + (SE)^2]}, \text{ where}$$

ΔC = change in CPS unemployment level and
ΔH = change in *Handbook* unemployment level

Appendix D. Changes in Occupational Classification System

Beginning with 1971, the comparability of occupational employment data was affected as a result of changes in census occupational classifications introduced into the Current Population Survey (CPS). These changes stemmed from an exhaustive review of the classification system to be used for the 1970 Census of Population. This review, the most comprehensive since the 1940 census, aimed to reduce the size of large groups, to be more specific about general and "not elsewhere classified" groups, and to provide information on significant emerging occupations. Differences in March 1970 employment levels tabulated on both the 1960 and 1970 classification systems ranged from a drop of 650,000 in operatives to an increase of 570,000 in service workers, much of which resulted from a shift between these two groups; the nonfarm laborers group increased by 420,000, and changes in other groups amounted to 220,000, or less.

An additional major group was created by splitting the operatives category into operatives, except transport, and transport equipment operatives. Separate data for these two groups first became available in January 1972. At the same time, several changes in titles, as well as in order of presentation, were introduced; for example, the title of the managers, officials, and proprietors group was changed to "managers and administrators, except farm," since only proprietors performing managerial duties are included in the category.

Apart from the effects of revisions in the occupational classification system beginning in 1971, comparability of occupational employment data was further affected in December 1971, when a question eliciting information on major activities or duties was added to the monthly CPS questionnaire in order to determine more precisely the occupational classification of individuals. This change resulted in several dramatic occupational shifts, particularly from managers and administrators to other groups. Thus, meaningful comparisons of occupational levels cannot be made between 1972 and prior periods. However, revisions in the occupational classification system as well as in the CPS questionnaire are believed to have had but a negligible impact on unemployment rates.

Additional information on changes in the occupational classification system of the CPS appears in "Revisions in Occupational Classifications for 1971" and "Revisions in the Current Population Survey" in the February 1971 and February 1972 issues, respectively, of *Employment and Earnings*.

Appendix E. Standard Error Tables

Estimates appearing in this report are based on a random sample of households, instead of a complete census of the population. As a consequence, the estimates are subject to sampling (as well as nonsampling) errors. In general, the error of a sample estimate varies inversely with the size of the sample and the size of the estimate. Hence, an estimate for a small area or for a subgroup constituting a small proportion of the population will tend to have a relatively higher error than an estimate for a large area or for a subgroup constituting a relatively large proportion of the population.

For example, if there are 1,000 unemployed persons in a labor force of 50,000, with a 2.0-percent unemployment rate, we can be confident 90 percent of the time that the true unemployment rate lies between 0.0 percent and 4.0 percent. On the other hand, if the labor force is 500,000 and the unemployment rate is also 2.0 percent then the unemployment rate lies between 1.4 percent and 2.6 percent. In other words, the smaller the cell, the less reliable the data (table 9).

Standard error tables make it possible to compute the relative error (standard error divided by estimate size) of a sample estimate, and to compare two sample estimates using a standard statistical test of significance.

This appendix contains a detailed set of standard error tables for States, SMSA's and central cities. Tables E-1 through E-6 pertain to State estimates. Tables E-1 and E-2 apply to estimates of civilian labor force, employment and unemployment, tables E-3 and E-4 apply to participation rates and percent distributions, and tables E-5 and E-6 to unemployment rates. Tables E-7 through E-9 pertain to SMSA's and central cities. Table E-7 applies to estimates of civilian labor force, employment and unemployment for areas controlled using an independent population estimate, and table E-8 applies to the same estimates for areas not controlled. Annual average estimates for all States, SMSA's, and central cities are adjusted using independently derived estimates of the population 16 years and over for the area. This procedure is designed to improve the reliability of the estimates. Table E-9 applies to unemployment rates. To compute standard errors for participation rates and percent distributions for SMSA's, use table E-3 and E-4 for the relevant State.

The standard errors in these tables can be used directly to develop 68-percent confidence intervals for sample estimates. Standard errors for 90-percent confidence intervals can be computed by multiplying the standard errors in these tables by 1.65. For 95-percent confidence intervals, use 1.96. In many cases, linear interpolation will be necessary to derive standard error estimates. For example, table E-1 contains no standard error for an estimate of 750,000. The interpolated standard error for an estimate of 750,000 for California is:

$$Z = \left[[(C - B) / (A - B)] \times (X - Y) \right] + Y$$

where:

A = published population size immediately above the size desired, 1,000,000.
B = published population size immediately below the size desired, 500,000.
C = population size desired, 750,000.
X = standard error of A, 30,000.
Y = standard error of B, 22,000.
Z = standard error of C.

The standard error tables in this publication should not be used with sample estimates appearing in Geographic Profile reports before 1974. I 1973, the Bureau of the Census introduced a new procedure for inflating sample estimates on a State basis. This procedure improved the estimates of employment and unemployment at the State level. Therefore, State estimates in earlier years generally will be subject to a wider range of error. Standard errors of estimates for earlier years appear in the relevant Geographic Profile reports.

Table E-1. Standard errors of estimated labor force, employment and unemployment for total and white workers, by State

Preface

This report is the latest in a series presenting geographic labor force data from the Current Population Survey. It provides 1976 annual averages for States and large metropolitan areas. Data for previous years may be found in the following Bureau of Labor Statistics publications: *Characteristics of Workers in Large States and SMSA's-1970* (Report 388); *Employment in Perspective: Regional Aspects of Unemployment, 1969-70* (Report 395); *Geographic Profile of Employment and Unemployment, 1971* (Report 402); 1972 (Report 421); 1973 (Report 431); 1974 (Report 452); 1975 (Report 481); and "Regional Differences in Employment and Unemployment, 1957-72," *Monthly Labor Review*, March 1974.

Material in this publication is in the public domain and may be reproduced without the permission of the Federal Government. Please credit the Bureau of Labor Statistics and cite the name and number of the publication.

This report was prepared in the Office of Employment Structure and Trends, Division of Local Area Unemployment Statistics, by Richard Rosen, Beverly Berg, and Robert Palmer. Overall direction was provided by Sylvia Small and technical supervision by Fred Cronkhite.

B. Geographic boundary definitions for Labor Market Areas 50

C. Standard error tables 54

Introduction

This report is divided into two sections. Section I presents 1976 annual average labor force and unemployment estimates for States and 204 large Labor Market Areas (LMA's) used by the Department of Labor in administering various Federal economic assistance programs such as the Comprehensive Employment and Training Act of 1973 and the Public Works Employment Act of 1976. State estimates are based directly on the Current Population Survey (CPS). Estimates for LMA's are based on both the CPS and data from the unemployment insurance system.

Section II presents 1976 annual average detailed demographic estimates based directly on the CPS, showing the labor force, employment, and unemployment for the first time for all 50 States, the District of Columbia and for the 30 largest Standard Metropolitan Statistical Areas (SMSA's) and 10 central cities. New analytic data added in this section include employment and unemployment by occupation, and reasons for unemployment.

In a few instances, 1976 estimates for a metropolitan area in section II differ from those in section I. This is the result of differences between the geographic definition of the LMA's determined by the Department of Labor and used for program purposes, and those of the SMSA's determined by the Office of Management and Budget and used by the Bureau of the Census in conducting the CPS. Geographic boundary definitions of the 204 large LMA's are shown in appendix B.

The reliability of labor market area estimates in section I which are not controlled directly by the CPS is in large part determined by the degree to which existing administrative data within each State and current estimating techniques are able to approximate the estimates which would have resulted if a Current Population Survey estimate had been possible. Consequently, less confidence should be placed in these data than in the estimates for geographic areas presented in section II. As indicated in the introduction to section II, the reliability of estimates based on the CPS varies inversely with the size of the sample upon which the estimate is based and the size of the estimate itself. A description of the sampling errors associated with each table in section II is included in appendix C.

Section I. Total Labor Force and Unemployment Estimates for States and Large Labor Market Areas

Table 1 presents 1976 annual averages of the labor force and unemployment in all 50 States. This is the first time such data are available from the CPS for all States. Formerly, data from the CPS were published for 27 of the largest States. The State estimates and the annual averages from the CPS for 27 of the largest SMSA's, marked with an asterisk (*) in table 2, are the most reliable unemployment estimates at the subnational level, since they are derived from the same source as the national unemployment rate. In addition, three areas, marked with a double asterisk (**), for which SMSA data are available from the CPS, have been adjusted to take account of differences between SMSA boundaries and LMA definitions. Definitions for the 204 LMA's are provided in appendix B.

Estimation procedures

Since 1972, when the Bureau of Labor Statistics (BLS) was given the responsibility for improving the unemployment estimates generated by State employment security agencies (SESA's), BLS has gradually introduced changes in methodology designed to establish a uniform concept of unemployment in all areas which would be consistent with the definitions used to measure unemployment at the national level. For a number of years, State employment security offices, using a standardized formula (*Handbook* method) developed by the Department of Labor, have prepared monthly estimates of employment and unemployment based on statistics from the unemployment insurance (UI) system.

The *Handbook* method is designed to derive monthly estimates of employment and unemployment for an area similar to estimates that would have resulted if a sample survey of households had been conducted, using the same concepts and definitions as are used in the official government measures based on the CPS. However, due to differences in State UI laws, the structural limitations of the *Handbook* method, and measurement errors in the UI data, *Handbook* estimates are considered less reliable for large areas than CPS estimates. As a consequence, annual average CPS labor force estimates are used to correct UI-based monthly *Handbook* estimates. Before the estimating procedure was revised, State and area estimates prepared by SESA's were totally independent of—and usually different from—estimates for the same area from the CPS. In 1976, State-prepared estimates for all States and 27 LMA's were benchmarked directly to the CPS annual averages. In addition, the CPS estimates for three SMSA's (New York, Minneapolis-St. Paul, and Denver-Boulder) were adjusted to conform to the LMA boundary. A more detailed description of the estimating process can be found in appendix A.

Other sources of data

Monthly labor force and unemployment estimates for States and 204 large LMA's based on this revised methodology appear monthly in the BLS periodical, *Employment and Earnings*, table E-1.

Labor force and unemployment estimates for counties, cities, and other small areas have been prepared for administration of various Federal economic assistance programs and may be ordered from the National Technical Information Service (NTIS), U.S. Department of Commerce, 5285 Port Royal Road, Springfield, Virginia 22161. A complete list of publications and price schedules is available upon request from NTIS. Because of the small size of many of the areas, as well as limitations of the data, such estimates are subject to considerable statistical error. The data have been developed solely to satisfy a program need and should not be used for time series analysis.

Table 1. Labor force and unemployment estimates by State, 1976 annual averages

(Numbers in thousands)

State	Civilian noninstitutional population	Civilian labor force	Unemployment	
			Number	Percent of civilian labor force

*Estimates for this area are taken from the Current Population Survey (CPS). Estimates *not marked* with an asterisk were derived from data drawn from the CPS and the unemployment insurance program. A description of the statistical methods used to derive these estimates is provided in appendix A.

**Estimates for this area are based on CPS estimates adjusted to conform to LMA boundaries. Boundary definitions are shown in appendix B.

Section II. Detailed Labor Force Estimates for States and Large Standard Metropolitan Statistical Areas

The data in this section are 1976 annual averages based on the Current Population Survey (CPS), a survey of about 55,000 households conducted monthly by the Bureau of the Census for the BLS.[1] Estimates are presented first for States (tables 3-8) and then for 30 SMSA's and 10 central cities (tables 9-13).

Population and labor force by sex, age, and race

Table 3 contains demographic data for States, and table 9 data for 30 SMSA's and 10 central cities. Estimates of the total labor force are shown separately, whenever possible, for white and for black and other workers, by sex and by selected age groups. Only groups with a labor force estimate of 50,000 or more are shown separately. Where the "black and other" labor force is less than 50,000, the corresponding white group is also not shown since, in such instances, there is no statistically significant difference between the estimates for all races shown and the white group.

Full- and part-time status

The number in the labor force by full- or part-time status is presented in tables 4 and 10. Such data were published by State in 1972, by region in 1973, and by State and area in 1975.

Occupational distribution of employment and unemployment

Two new tables provide estimates of employment and unemployment by occupation for States (table 5) and metropolitan areas (table 11).

In tables 6 and 12, employment distribution by major occupation is shown for States and areas. Occupational distributions were first published in the 1974 edition of this report, and were expanded to include distributions by sex and by race in 1975. Data appearing in an earlier BLS report, *Occupational Characteristics of Urban Workers, 1970* (Special Labor Force Report 138) are not strictly comparable because of changes in occupational definitions. Occupational classifications used in this and the preceding two editions are consistent with the new occupational definitions introduced in the 1970 Census and first published in the national CPS estimates in 1972.

Unemployment by duration and reason

Data showing unemployed persons by duration of unemployment in States and large SMSA's appear in tables 7 (States) and 13 (SMSA's), with the proportion of unemployed by the length of the period of unemployment shown.

Table 8 shows the number of unemployed by reason for unemployment, by State. This is the first time such data have been published below the national level. The unemployed are classified into four groups: Those who lost their jobs, those who left their jobs voluntarily, those who have reentered the labor force after a period of separation, and those who are entering the labor force for the first time.

Reliability of estimates

The amount of detail published for States and metropolitan areas is determined to a large extent by the statistical quality of the estimates. In line with previous geographic reports, estimates for a specific subgroup are not published if the civilian labor force is less than 50,000. As indicated in appendix C, the error varies inversely with the size of the area and the size of the estimate. Consequently, data for small areas or small subgroups are less reliable. Standard error tables in appendix C have been provided to enable users to evaluate the statistical reliability of each sample estimate. The Bureau suggests that users consult these tables before developing any comparative analyses, since in some cases an apparent change in a statistic (or difference between two statistics) will prove insignificant when its relative error is considered.

[1] The Current Population Survey was increased by some 8,000 households in 23 States in 1975. However, statistics referring to the national labor force continue to be based on 47,000 households, the same number as in earlier years.

Appendix A. Procedures for Estimating Employment and Unemployment for States and Areas

Federal-State cooperative program

Labor force and unemployment estimates for States, Labor Market Areas (LMA's), and other areas specifically defined for fund allocation purposes are developed under a Federal-State cooperative program and transmitted each month to BLS. Local unemployment estimates approved by BLS are the basis for determining eligibility of an area for benefits under Federal economic assistance programs such as those established by the Comprehensive Employment and Training Act of 1973 (CETA), and the Public Works Employment Act of 1976.

Since November 1972, the BLS has been responsible for developing the concepts and methods used by State employment security agencies to estimate State and local area labor force, employment, and unemployment. In December 1975, the Office of Management and Budget extended this responsibility to include the publication of such estimates. Earlier, State agencies had prepared estimates using a method developed by the Department of Labor in the 1950's, generally referred to as the *Handbook* method (BES Report No. R-185). The new system conbines the *Handbook* method with adjustments based on the concepts and definitions used in the national Current Population Survey (CPS).

Preliminary estimate–employment

Under the new system, total employment estimates are on a "persons by place of residence" basis rather than on a "jobs by place of work" basis. Using relationships which existed at the time of the 1970 Decennial Census, adjustment factors for major categories of employment by class of worker and industry have been developed. These factors are applied to the payroll employment estimates for the current period to obtain an adjusted employment figure which is incorporated into the *Handbook* estimate.

Although not affecting State totals appreciably, the change can modify estimates in substate areas where commuting to work is substantial–by raising the employment estimate in areas where people reside, and lowering it in areas where they work. The change may raise or lower the unemployment rate.

Although the concept of employment has changed from place of work to place of residence, definitions and procedures for estimating nonagricultural wage and salary employment by industry–the count of payroll jobs by place of work–remain exactly the same.

Preliminary estimate–unemployment

Unemployment estimates computed by State employment security agencies (SESA's) are developed each month by following a building block approach, which uses data from a variety of administrative and survey sources. Unemployment is an aggregate of estimates for each of three building block categories: (1) Persons who were previously employed in industries covered by State unemployment insurance (UI) laws; (2) those previously employed in industries not covered by these laws; and (3) those who were either entering the labor force for the first time or reentering after a period of separation.

Those previously employed in covered industries are derived from counts of (1) current unemployment insurance claimants and (2) persons disqualified from receiving benefits for nonmonetary reasons (because they quit, were discharged for cause, etc., but otherwise would have been eligible); and estimates of (3) claimants whose benefits have been exhausted and (4) persons who either filed claims late or did not file.

Unemployment in industries not covered by UI is estimated from the current ratio of covered unemployment to covered employment, applied to the employment estimate for each industry or class of worker subgroup in the State, weighted by factors reflecting national historical relationships between covered and noncovered industries.

For the third category, new entrants and reentrants into the labor force, a composite estimate is developed from equations that relate total entrants into the labor force to the experienced labor force and experienced unemployed.

Because UI laws and administrative regulations vary from State to State, differences in the levels of insured unemployment between States may not necessarily correlate with differences in total unemployment. Although new procedures have been instituted designed to reconcile these differences, evidence indicates that estimates of total unemployment for States still reflect differences in the eligibility provisions of State UI laws. Consequently, annual data from the CPS are used to correct the State-prepared estimates, either directly for the States and for the 30 areas for which CPS estimates are available, or by using the residual

remaining in each State when employment and unemployment in the CPS areas are subtracted from the State totals to obtain annual averages for other areas.

Benchmark correction and extrapolation procedures

Once each year BLS adjusts or benchmarks all monthly estimates prepared by SESA's under the *Handbook* method to annual average estimates resulting from the CPS. This adjustment is necessary because the State-prepared estimates are less reliable than CPS estimates due to differences in State UI laws, structural limitations of the *Handbook* method, and errors in the UI data.

The criterion used by BLS to determine whether annual average labor force estimates form the CPS for a given area can be used directly for benchmarking purposes is quite specific. With a 6-percent unemployment rate, the unemployment estimates for that area must have a relative error (standard error divided by sample estimate) of 10 percent or less at 1 standard error. If repeated samples using identical procedures were drawn in that area, the true unemployment level would be contained in a 10-percent interval around the sample estimate 68 percent of the time. (The method for the benchmark correction process is outlined below.) In 1973, 19 States and 30 SMSA's met this criterion. During 1974 and 1975, the number of States that were benchmarked using CPS sample estimates for the State increased to 27. In 1975, SESA estimates in 23 smaller States were adjusted, on the basis of the aggregate CPS estimates for those States, to produce consistent unemployment estimates in all States. Supplementation to the CPS in these 23 States was begun in mid-1975 to increase the reliability of the annual average CPS estimates. As a result of this supplementation, employment and unemployment estimates in all 50 States in 1976 were benchmarked to the State CPS annual averages shown in section I of this report.

Benchmarked estimates are produced in three stages. First, the monthly *Handbook* estimates are adjusted by the ratio of the CPS and *Handbook* annual averages. Second, the difference between the ratio of annual averages for 2 consecutive years is wedged into the monthly estimates to minimize the disturbance to the original series. Finally, second-stage estimates are forced to agree with CPS annual averages.

Benchmarked estimates are extrapolated into the current year by applying the latest relevant correction factor to the current monthly *Handbook* estimates of employment and unemployment. The employment factor used in year (t) is the quotient of the December employment benchmark and *Handbook* estimates in year (t-1). The unemployment factor for year (t) is the algebraic difference between the December unemployment benchmark and *Handbook* estimates in year (t-1). The preliminary estimate for each month in the current year is then the result of applying the correction factor by multiplication (for employment), or by addition (for unemployment) to the current *Handbook* estimate.

Appendix B. Geographic Boundary Definitions for Labor Market Areas

This appendix lists the geographic boundary definitions of 205 large Labor Market Areas (LMA's) designated by the Department of Labor. The Department of Labor has used LMA's for a number of years for various administrative and program purposes. Designed to measure conditions of the labor force within reasonable commuting distance of a large central city (or cities), the geographic boundaries for almost all LMA's are the same as those for Standard Metropolitan Statistical Areas (SMSA's) as defined by the Office of Management and Budget (OMB) (See definition). OMB uses a set of uniform criteria to determine the geographic boundaries of SMSA's. By way of contrast, State employment security agencies and the Department of Labor jointly define LMA's. Since many LMA's were established before they were designated as an SMSA, a few areas with boundary differences often reflect this initial classification discrepancy.

In this report, estimates for the 30 largest LMA's are based directly on the Current Population Survey (CPS), except in New York, Minneapolis-St. Paul, and Denver-Boulder, where the CPS estimates (based on the SMSA) must be adjusted to reflect the difference in area definitions of the LMA and SMSA. Estimates in section I refer to LMA's, while estimates in section II refer to SMSA's.

An SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are comprised of cities and towns, the minimum population size is 75,000.

The OMB occasionally revises the SMSA geographic definitions. The latest set of SMSA definitions is contained in *Standard Metropolitan Statistical Areas, Revised Edition, 1975*, issued by the Office of Management and Budget.

When OMB revises the geographic definition of an SMSA, the Bureau of the Census must revise the CPS sample for that area to produce consistent estimates. This revision creates a break in the time series for that area. In 1973, estimates based on revised boundary definitions were introduced for the New York and Los Angeles SMSA's and, in 1974, for 12 additional SMSA's. Appendix B of *Geographic Profile of Employment and Unemployment, 1975* shows the changes in the geographic boundaries of the 30 largest SMSA's. LMA definitions are also revised periodically. The definitions shown in table B-1 are the boundaries upon which the 1976 estimates are based.

Table B-1. Labor Market Area Definitions

ALABAMA	
Birmingham	Jefferson, St. Clair, Shelby, and Walker Counties
Huntsville	Limestone, Madison, and Marshall Counties
Mobile	Baldwin and Mobile Counties
Montgomery	Autauga, Elmore, and Montgomery Counties
Tuscaloosa	Tuscaloosa County
ARIZONA	
Phoenix	Maricopa County
Tucson	Pima County
ARKANSAS	
Fayetteville-Springdale	Benton and Washington Counties
Fort Smith	Crawford and Sebastian Counties, Ark.; Le Flore and Sequoyah Counties, Okla.
Little Rock-N. Little Rock	Pulaski and Saline Counties
Pine Bluff	Jefferson County
CALIFORNIA	
Anaheim-Santa Ana-Garden Grove	Orange County
Bakersfield	Kern County
Fresno	Fresno County
Los Angeles-Long Beach	Los Angeles County
Modesto	Stanislaus County
Oxnard-Simi Valley-Ventura	Ventura County
Riverside-San Bernardino-Ontario	San Bernardino and Riverside Counties
Sacramento	Placer, Sacramento, and Yolo Counties
Salinas-Seaside-Monterey	Monterey County
San Diego	San Diego County
San Francisco-Oakland	Alameda, Contra Costa, Marin, San Francisco, and San Mateo Counties
San Jose	Santa Clara County
Santa Barbara-Santa Maria-Lompoc	Santa Barbara County
Santa Rosa	Sonoma County
Stockton	San Joaquin County
Vallejo-Fairfield-Napa	Napa and Solano Counties
COLORADO	
Denver-Boulder[1]	Adams, Arapahoe, Boulder, Clear Creek, Denver, Douglas, Gilpin, and Jefferson Counties
CONNECTICUT	
Bridgeport	Bridgeport and Shelton cities, and Easton, Fairfield, Monroe, Stratford, and Trumbull towns in Fairfield County; Derby and Milford cities in New Haven County (formerly excluded Derby city)
Hartford	Hartford city, and Avon, Bloomfield, Canton, East Granby, East Hartford, East Windsor, Enfield, Farmington, Glastonbury, Granby, Manchester, Marlborough, Newington, Rocky Hill, Simsbury, South Windsor, Suffield, West Hartford, Wethersfield, Windsor, and Windsor Locks towns in Hartford County; Colchester town in New London County; Andover, Bolton, Columbia, Coventry, Ellington, Hebron, Somers, Stafford, Tolland, Vernon, and Willington towns in Tolland County (formerly excluded Andover, Colchester, Columbia, Coventry, Hebron, Marlborough, and Willington towns)
New Britain	New Britain city, and Berlin, Plainville, and Southington towns in Hartford County (formerly excluded Southington town)
New Haven-West Haven	Clinton and Killingworth towns in Middlesex County; New Haven and West Haven cities, and Bethany, Branford, East Haven, Guilford, Hamden, Madison, North Branford, North Haven, Orange, Wallingford, and Woodbridge towns in New Haven County (formerly excluded Clinton, Killingworth, and Wallingford towns)
Stamford	Stamford city, and Darien, Greenwich, and New Canaan towns in Fairfield County
Waterbury	Waterbury city, Naugatuck borough, and Beacon Falls, Cheshire, Middlebury, Prospect, Southbury, and Wolcott towns in New Haven County; Bethlehem, Thomaston, Watertown, and Woodbury towns in Litchfield County
DELAWARE	
Wilmington	New Castle County, Del.; Cecil County, Md.; Salem County, N. J.
DISTRICT OF COLUMBIA	
Washington SMSA	District of Columbia; Charles, Montgomery, and Prince Georges Counties, Md.; Alexandria, Fairfax, Falls Church, Manassas, and Manassas Park cities, and Arlington, Fairfax, Loudoun, and Prince William Counties, Va.
FLORIDA	
Fort Lauderdale-Hollywood	Broward County
Jacksonville	Baker, Clay, Duval, Nassau, and St. Johns Counties
Miami	Dade County
Orlando	Orange, Osceola, and Seminole Counties
Pensacola	Escambia and Santa Rosa Counties
Tampa-St. Petersburg	Hillsborough, Pasco, and Pinellas Counties
West Palm Beach-Boca Raton	Palm Beach County
GEORGIA	
Atlanta	Butts, Cherokee, Clayton, Cobb, De Kalb Douglas, Fayette, Forsyth, Fulton, Gwinnett, Henry, Newton, Paulding, Rockdale, and Walton Counties
Augusta	Columbia and Richmond Counties, Ga.; Aiken County, S. C.
Columbus	Columbus (consolidated government), and Chattahooche County, Ga.; Russell County, Ala.
Macon	Bibb, Houston, Jones, and Twiggs Counties
Savannah	Bryan, Chatham, and Effingham Counties
HAWAII	
Honolulu	Honolulu County
IDAHO	
Boise City	Ada County
ILLINOIS	
Bloomington-Normal	McLean County
Champaign-Urbana-Rantoul	Champaign County
Chicago	Cook, Du Page, Kane, Lake, McHenry, and Will Counties
Davenport-Rock Island-Moline	Henry and Rock Island Counties, Ill.; Scott County, Iowa
Decatur	Macon County
Peoria	Peoria, Tazewell, and Woodford Counties
Rockford	Boone and Winnebago Counties
Springfield	Menard and Sangamon Counties
INDIANA	
Evansville	Gibson, Posey, Vanderburgh, and Warrick Counties, Ind.; Henderson County, Ky.
Fort Wayne	Adams, Allen, DeKalb, and Wells Counties
Gary-Hammond-East Chicago	Lake and Porter Counties
Indianapolis	Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, and Shelby Counties
Muncie	Delaware County
South Bend	Marshall and St. Joseph Counties
Terre Haute	Clay, Sullivan, Vermillion, and Vigo Counties
IOWA	
Cedar Rapids	Linn County
Des Moines	Polk and Warren Counties
Dubuque	Dubuque County
Sioux City	Woodbury County, Iowa; Dakota County, Neb.
Waterloo-Cedar Falls	Black Hawk County
KANSAS	
Topeka	Jefferson, Osage, and Shawnee Counties
Wichita	Butler and Sedgwick Counties
KENTUCKY	
Lexington-Fayette	Bourbon, Clark, Fayette, Jessamine, Scott, and Woodford Counties
Louisville	Bullitt, Jefferson, and Oldham Counties, Ky.; Clark and Floyd Counties, Ind.
LOUISIANA	
Baton Rouge	Ascension, East Baton Rouge, Livingston, and West Baton Rouge Parishes
Lake Charles	Calcasieu Parish
Monroe	Ouachita Parish
New Orleans	Jefferson, Orleans, St. Bernard, and St. Tammany Parishes
Shreveport	Bossier, Caddo, and Webster Parishes

See notes at end of table.

Table B-1. Labor Market Area Definitions—Continued

MAINE	
Lewiston-Auburn	Auburn and Lewiston cities, and Lisbon town in Androscoggin County
Portland	Portland, South Portland, and Westbrook cities, and Cape Elizabeth, Cumberland, Falmouth, Freeport, Gorham, Scarborough, Windham, and Yarmouth towns in Cumberland County; Saco city, and Old Orchard Beach town in York County
MARYLAND	
Baltimore	Baltimore city, and Anne Arundel, Baltimore, Carroll, Harford, and Howard Counties
MASSACHUSETTS	
Boston	Suffolk County; Cambridge, Everett, Malden, Medford, Melrose, Newton, Somerville, Waltham, and Woburn cities, and Acton, Arlington, Ashland, Bedford Belmont, Boxborough, Burlington, Carlisle, Concord, Framingham, Holliston, Lexington, Lincoln, Natick, North Reading, Reading, Sherborn, Stoneham, Sudbury, Wakefield, Watertown, Wayland, Weston, Wilmington, and Winchester towns in Middlesex County; Beverly, Lynn, Peabody, and Salem cities, and Boxford, Danvers, Hamilton, Lynnfield, Manchester, Marblehead, Middleton, Nahant, Saugus, Swampscott, Topsfield, and Wenham towns in Essex County; Quincy city, and Bellingham, Braintree, Brookline, Canton, Cohasset, Dedham, Dover, Foxborough, Franklin, Holbrook, Medfield, Medway, Millis, Milton, Needham, Norfolk, Norwood, Randolph, Sharon, Stoughton, Walpole, Wellesley, Westwood, Weymouth, and Wrentham towns in Norfolk County; Abington, Duxbury, Hanover Hanson, Hingham, Hull, Kingston, Marshfield, Norwell, Prembroke, Rockland, and Scituate towns in Plymouth County (formerly excluded Abington, Acton, Bellingham, Boxborough, Boxford, Carlisle, Foxborough, Franklin, Hanson, Holliston, Kingston, Medway, Stoughton, and Wrentham towns)
Brockton	Brockton city, and Bridgewater, East Bridgewater, Halifax, West Bridgewater, and Whitman towns in Plymouth County; Easton town in Bristol County; Avon town in Norfolk County (formerly excluded Halifax town and included Stoughton town in Norfolk County and Abington and Hanson towns in Plymouth County)
Fall River	Fall River city, and Dighton, Somerset, Swansea, and Westport towns in Bristol County, Mass.; Little Compton and Tiverton towns in Newport County, R. I. (formerly excluded Dighton and Little Compton towns)
Lawrence-Haverhill	Lawrence and Haverhill cities, and Amesbury, Andover, Georgetown, Groveland, Merrimac, Methuen, North Andover, Salisbury, and West Newbury towns in Essex County, Mass.; Atkinson, Hampstead, Kingston, Newton, Plaistow, Salem, and Windham towns in Rockingham County, N. H. (formerly excluded Amesbury, Atkinson, Hampstead, Kingston, Salisbury, and Windham towns)
Lowell	Lowell city, and Billerica, Chelmsford, Dracut, Dunstable, Tewksbury, Tyngsborough, and Westford towns in Middlesex County (formerly excluded Dunstable town)
New Bedford	New Bedford city, and Acushnet, Dartmouth, Fairhaven, and Freetown towns in Bristol County; Lakeville, Marion, Mattapoisett, and Rochester towns in Plymouth County (formerly excluded Freetown, Lakeville, and Rochester towns)
Springfield-Chicopee-Holyoke	Chicopee, Holyoke, Springfield, and Westfield cities, and Agawam, Brimfield, East Longmeadow, Granville, Hampden, Longmeadow, Ludlow, Monson, Montgomery, Palmer, Russell, Southwick, Wales, West Springfield, and Wilbraham towns in Hampden County; Northampton city, and Amherst, Belchertown, Chesterfield, Easthampton, Granby, Hadley, Hatfield, Pelham, South Hadley, Southampton, Westhampton, and Williamsburg towns in Hampshire County; Warren town in Worcester County (formerly excluded Amherst, Belchertown, Brimfield, Chesterfield, Granville, Hatfield, Montgomery, Pelham, Russell, Southampton, Wales, Westhampton, and Williamsburg towns)
Worcester	Worcester city, and Auburn, Berlin, Boylston, Brookfield, Charlton, Douglas, East Brookfield, Grafton, Holden, Leicester, Millbury, Northborough, Northbridge, North Brookfield, Oxford, Paxton, Rutland, Shrewsbury, Spencer, Sterling, Sutton, Upton, Uxbridge, Webster, Westborough, and West Boylston towns in Worcester County (formerly excluded Charlton, Douglas, Rutland, Uxbridge, and Webster towns)
MICHIGAN	
Ann Arbor	Washtenaw County
Battle Creek	Barry and Calhoun Counties
Bay City	Bay County
Detroit	Lapeer, Livingston, Macomb, Oakland, St. Clair, and Wayne Counties
Flint	Genesee and Shiawassee Counties
Grand Rapids	Kent and Ottawa Counties
Jackson	Jackson County
Kalamazoo-Portage	Kalamazoo and Van Buren Counties
Lansing-East Lansing	Clinton, Eaton, Ingham, and Ionia Counties
Muskegon-Norton Shores-Muskegon Heights	Muskegon and Oceana Counties
Saginaw	Saginaw County
MINNESOTA	
Duluth-Superior	Duluth city, Minn.; Douglas County, Wisc.
Minneapolis-St. Paul[2]	Anoka, Carver, Chisago, Dakota, Hennepin, Ramsey, Scott, Washington, and Wright Counties
MISSISSIPPI	
Jackson	Hinds and Rankin Counties
MISSOURI	
Kansas City	Cass, Clay, Jackson, Platte, and Ray Counties, Mo.; Johnson and Wyandotte Counties, Kans.
St. Joseph	Andrew and Buchanan Counties
St. Louis	St. Louis city, and Franklin, Jefferson, St. Charles, and St. Louis Counties, Mo.; Clinton, Madison, Monroe, and St. Clair Counties, Ill.
Springfield	Christian and Greene Counties
MONTANA	
Billings	Yellowstone County
Great Falls	Cascade County
NEBRASKA	
Lincoln	Lancaster County
Omaha	Douglas and Sarpy Counties, Nebr.; Pottawattamie County, Iowa
NEVADA	
Las Vegas	Clark County; Beatty Township in Nye County
Reno	Washoe County
NEW HAMPSHIRE	
Manchester	Manchester city, and Bedford and Goffstown towns in Hillsborough County; Allenstown, Hooksett, and Pembroke towns in Merrimack County; Derry and Londerry towns in Rockingham County (formerly excluded Allenstown, Derry, Pembroke, and Londerry towns)
NEW JERSEY	
Atlantic City	Atlantic County
Jersey City	Hudson County
Long Branch-Asbury Park	Monmouth County
New Brunswick-Perth Amboy-Sayreville	Middlesex County
Newark	Essex, Morris, Somerset, and Union Counties
Paterson-Clifton-Passaic	Passaic County
Trenton	Mercer County
Vineland-Millville-Bridgeton	Cumberland County
NEW MEXICO	
Albuquerque	Bernalillo and Sandoval Counties
NEW YORK	
Albany-Schenectady-Troy	Albany, Montgomery, Rensselaer, Saratoga, and Schenectady Counties
Binghamton	Broome and Tioga Counties, N. Y.; Susquehanna County, Pa.
Buffalo	Erie and Niagara Counties
Elmira	Chemung County
Nassau-Suffolk	Nassau and Suffolk Counties
New York[3]	New York City, and Putnam, Rockland and Westchester Counties
Poughkeepsie	Dutchess County
Rochester	Livingston, Monroe, Ontario, Orleans, and Wayne Counties
Syracuse	Madison, Onondaga, and Oswego Counties
Utica-Rome	Herkimer and Oneida Counties

See notes at end of table.

Table B-1. Labor Market Area Definitions—Continued

NORTH CAROLINA	
Asheville	Buncombe and Madison Counties
Charlotte-Gastonia	Gaston, Mecklenburg, and Union Counties
Greensboro—Winston-Salem—High Point	Davidson, Forsyth, Guilford, Randolph, Stokes, and Yadkin Counties
Raleigh-Durham	Durham, Orange, and Wake Counties
NORTH DAKOTA	
Fargo-Moorhead	Cass County, N. D.; Clay County, Minn.
OHIO	
Akron	Portage and Summit Counties
Canton	Carroll and Stark Counties (formerly limited to Carroll County)
Cincinnati	Clermont, Hamilton, and Warren Counties, Ohio; Boone, Campbell, and Kenton Counties, Ky.; Dearborn County, Ind.
Cleveland	Cuyahoga, Geauga, Lake, and Medina Counties
Columbus	Delaware, Fairfield, Franklin, Madison, and Pickaway Counties (formerly excluded Fairfield and Madison Counties)
Dayton	Greene, Miami, Montgomery, and Preble Counties
Toledo	Fulton, Lucas, Ottawa, and Wood Counties, Ohio; Monroe County, Mich. (formerly excluded Fulton and Ottawa Counties, Ohio)
Youngstown-Warren	Mahoning and Trumbull Counties
OKLAHOMA	
Oklahoma City	Canadian, Cleveland, McClain, Oklahoma, and Pottawatomie Counties
Tulsa	Creek, Mayes, Osage, Rogers, Tulsa, and Wagoner Counties
OREGON	
Eugene-Springfield	Lane County
Portland	Clackamas, Multnomah, and Washington Counties, Oreg.; Clark County, Wash.
Salem	Marion and Polk Counties
PENNSYLVANIA	
Allentown-Bethlehem-Easton	Carbon, Lehigh, and Northampton Counties, Pa.; Warren County, N. J.
Altoona	Blair County
Erie	Erie County
Harrisburg	Cumberland, Dauphin, and Perry Counties
Johnstown	Cambria and Somerset Counties
Lancaster	Lancaster County
Northeast-Pennsylvania	Lackawanna, Luzerne, and Monroe Counties
Philadelphia	Bucks, Chester, Delaware, Montgomery, and Philadelphia Counties, Pa.; Burlington, Camden, and Gloucester Counties, N. J.
Pittsburgh	Allegheny, Beaver, Washington, and Westmoreland Counties
Reading	Berks County
Williamsport	Lycoming County
York	Adams and York Counties
RHODE ISLAND	
Providence-Warwick-Pawtucket	Central Falls, Cranston, East Providence, Pawtucket, Providence, and Woonsocket cities, and Burrillville, Cumberland, Foster, Glocester, Johnston, Lincoln, North Providence, North Smithfield, Scituate, and Smithfield towns in Providence County, R. I.; Exeter, Narragansett, North Kingstown, Richmond, and South Kingstown towns in Washington County, R. I.; Warwick city, and Coventry, East Greenwich, West Greenwich, and West Warwick towns in Kent County, R. I.; Jamestown and New Shoreham towns in Newport County, R. I.; Bristol County, R. I.; Attleboro city, and North Attleboro, Norton, Rehoboth, and Seekonk towns in Bristol County, Mass.; Plainville town in Norfolk County, Mass.; Blackstone and Millville towns in Worcester County, Mass.
SOUTH CAROLINA	
Charleston-North Charleston	Berkeley, Charleston, and Dorchester Counties
Columbia	Lexington and Richland Counties
Greenville-Spartanburg	Greenville, Pickens, and Spartanburg Counties
SOUTH DAKOTA	
Sioux Falls	Minnehaha County
TENNESSEE	
Chattanooga	Hamilton, Marion, and Sequatchie Counties, Tenn.; Catoosa, Dade, and Walker Counties, Ga.
Knoxville	Anderson, Blount, Knox, and Union Counties; portion of Oak Ridge in Roane County
Memphis	Shelby and Tipton Counties, Tenn.; Crittenden County, Ark.
Nashville-Davidson	Cheatham, Davidson, Dickson, Robertson, Rutherford, Sumner, Williamson, and Wilson Counties
TEXAS	
Amarillo	Potter and Randall Counties
Austin	Hays and Travis Counties
Beaumont-Port Arthur-Orange	Hardin, Jefferson, and Orange Counties
Corpus Christi	Nueces and San Patricio Counties
Dallas-Fort Worth	Collin, Dallas, Denton, Ellis, Hood, Johnson, Kaufman, Parker, Rockwall, Tarrant, and Wise Counties
El Paso	El Paso County
Galveston-Texas City	Galveston County
Houston	Brazoria, Fort Bend, Harris, Liberty, Montgomery, and Waller Counties
Lubbock	Lubbock County
San Antonio	Bexar, Comal, and Guadalupe Counties
Waco	McLennan County
Wichita Falls	Clay and Wichita Counties
UTAH	
Salt Lake City-Ogden	Davis, Morgan, Salt Lake, Tooele, and Weber Counties
VIRGINIA	
Lynchburg	Lynchburg city, and Amherst, Appomattox, and Campbell Counties
Newport News-Hampton	Hampton, Newport News, and Williamsburg cities, and James City and York Counties
Norfolk-Virginia Beach-Portsmouth	Chesapeake, Norfolk, Portsmouth, Suffolk, and Virginia Beach cities, Va.; Currituck County, N. C.
Richmond	Richmond city, and Charles City, Chesterfield, Goochland, Hanover, Henrico, and Powhatan Counties
Roanoke	Roanoke and Salem cities, and Botetourt, Craig, and Roanoke Counties
WASHINGTON	
Seattle-Everett	King and Snohomish Counties
Spokane	Spokane County
Tacoma	Pierce County
WEST VIRGINIA	
Charleston	Kanawha and Putnam Counties
Huntington-Ashland	Cabell and Wayne Counties, W. Va.; Boyd and Greenup Counties, Ky.; Lawrence County, Ohio
Parkersburg-Marietta	Wirt and Wood Counties, W. Va.; Washington County, Ohio
Wheeling	Marshall and Ohio Counties, W. Va.; Belmont County, Ohio
WISCONSIN	
Appleton-Oshkosh	Calumet, Outagamie, and Winnebago Counties
Green Bay	Brown County
Kenosha	Kenosha County
La Crosse	La Crosse County
Madison	Dane County
Milwaukee	Milwaukee, Ozaukee, Washington, and Waukesha Counties
Racine	Racine County

[1] Data for Denver-Boulder SMSA in section II *exclude* Clear Creek County, Colorado.

[2] Data for Minneapolis-St. Paul SMSA in section II *include* St. Croix County, Wisconsin.

[3] Data for New York SMSA in section II *include* Bergen County, New Jersey.

Appendix C. Standard Error Tables

CPS sample design

The estimates in section II of this report are based on a sample of the population rather than a complete count. Consequently, the estimates may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures. In general, the error of a sample estimate varies inversely with the size of the sample and the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of the population within an area will tend to have a relatively higher error than an estimate for a subgroup constituting a large proportion of the population within that area. In addition, the error associated with a given sample estimate will vary from State to State because of differences in the size of the survey and the size of the estimate relative to the population.

Using the standard error tables

Standard error tables make it possible to compute the relative error (standard error divided by estimate size) of a sample estimate, and to compare two sample estimates using a standard statistical test of significance.

This appendix contains a detailed set of standard error tables for States, SMSA's, and central cities. Tables C-1 through C-8 pertain to State estimates. Tables C-9 through C-16 pertain to SMSA's and central cities. These standard errors should not be applied to those area estimates in table 2 of section I which are not based on the CPS.

The standard errors in these tables can be used directly to develop 68-percent confidence intervals for sample estimates. Standard errors for 90-percent confidence intervals can be computed by multiplying the standard errors in these tables by 1.65; for 95-percent confidence intervals, 1.96 should be used. In many cases, linear interpolation will be necessary to derive standard error estimates. For example, table C-1 contains no standard error for an estimate of 750,000. The interpolated standard error for an estimate of 750,000 for California is:

$$Z = [[(C-B) / (A-B)] \times (X-Y)] + Y$$

where:

A = published size immediately above the size desired, 1,000,000.
B = published size immediately below the size desired, 500,000.
C = size desired, 750,000.
X = standard error of A, 31,000.
Y = standard error of B, 24,000.
Z = standard error of C.

The standard error tables in this publication should not be applied to sample estimates appearing in earlier *Geographic Profile* reports. In 1973, the Bureau of the Census introduced a new procedure for inflating sample estimates on a State basis. This procedure improved the estimates of employment and unemployment at the State level. Therefore, State estimates before 1973 will generally be subject to a wider range of error. Standard errors are revised each year to take into account the decrease in reliability which occurs when a fixed sample size is used to estimate labor force status from a growing population.

The standard error tables should be used somewhat differently depending on the type of comparison being made:

1. For a difference between the sample figure and one which would have resulted if a complete count had been possible, the standard error is identical with the standard error of the sample estimate alone.

2. For a difference between two sample figures (that is, one from the 1973 and the other from 1976 reports, or both from the same year), the standard error is approximately the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error for the difference between estimates of the same characteristics in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

3. For a difference between two sample estimates, one of which represents a subclass of the other, the error tables can be used directly, with the difference considered as the error associated with the sample estimate.

Table C-1. Standard errors of estimated numbers of total or white unemployed by State

(Numbers in thousands)

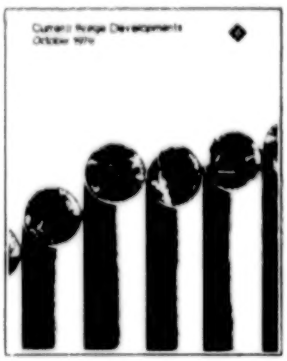
Periodicals from BLS

The Bureau of Labor Statistics of the U.S. Department of Labor is one of the Nation's principal economic fact-finding agencies. BLS publishes seven periodicals for sale to the public.

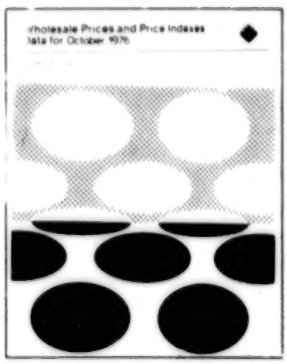


Monthly Labor Review
The oldest and most authoritative Government research journal in economics and social sciences. Book reviews, developments in industrial relations, labor cases.

$16 a year.

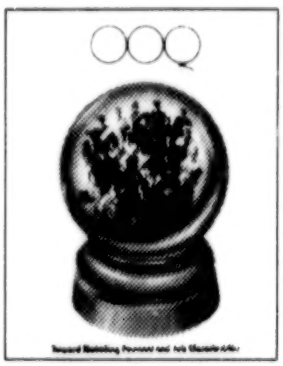
CPI Detailed Report
The most comprehensive report on monthly consumer price indexes and rates of change. Includes data on commodity and service groups for 23 cities.

$9 a year.



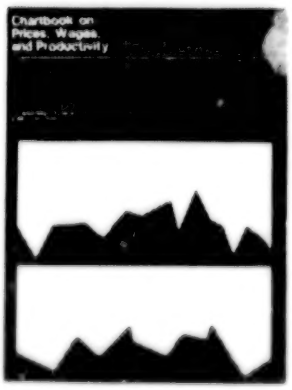
Current Wage Developments
Reports on specific wage and benefit changes from collective bargaining agreements. Includes detailed statistics on employee compensation.

$12 a year.



Employment and Earnings
A report on labor force, employment, and earnings. Current statistics for the Nation as a whole, individual States, and more than 200 areas.

$18 a year.



Wholesale Prices and Price Indexes
Wholesale price movements including those of industrial commodities and farm products, processed foods, and feeds. Greater detail than available elsewhere. Tables and charts.

$16 a year.

Occupational Outlook Quarterly
Helps pinpoint tomorrow's jobs and their requirements in easy-to-read form. Brings **Occupational Outlook Handbook** up-to-date, gives pay, background needed.

$4 four issues.

Chartbook on Prices, Wages, and Productivity
Trends in key economic indicators and comparisons shown in both tabular and graphic form month-to-month and within historic context.

$11 a year.

To subscribe to the **Monthly Labor Review,** write to the **Monthly Labor Review,** Box 353, La Plata, Md. 20646.

To subscribe to other BLS periodicals, write to the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402. For subscriptions to foreign countries, add 25 percent to all prices.

Make all checks payable to the Superintendent of Documents.

U.S. DEPARTMENT OF LABOR
Ray Marshall, Secretary

Bureau of Labor Statistics
Julius Shiskin, Commissioner
October 1978

Preface

This report is the latest in a series presenting 1977 labor force data for States based primarily on the Current Population Survey—the survey used to estimate national unemployment. Demographic data for metropolitan areas are not currently available. Section I provides 1977 annual average estimates of the labor force, employment, and unemployment. Section II provides monthly estimates of unemployment rates. The appendixes describe the estimating procedures and provide tables for determining error ranges and the significance of differences in the estimates.

Data for previous years may be found in the following Bureau of Labor Statistics publications: "Regional Differences in Employment and Unemployment, 1957-72," *Monthly Labor Review*, March 1974; *Characteristics of Workers in Large States and SMSA's—1970* (Report 388); *Employment in Perspective: Regional Aspects of Unemployment, 1969-70* (Report 395); *Geographic Profile of Employment and Unemployment, 1971* (Report 402); *1972* (Report 421); *1973* (Report 431); *1974* (Report 452); *1975* (Report 481); and *1976* (Report 504).

This report was prepared in the Office of Employment Structure and Trends, Division of Local Area Unemployment Statistics, by Richard Rosen, Anderia Thomas, and Russ Marshall, under the direction of Sylvia Small. Fred R. Cronkhite provided technical supervision.

Material in this publication is in the public domain and may be reproduced without the permission of the Federal Government. Please credit the Bureau of Labor Statistics and cite *State Profile of Employment and Unemployment, 1977*, Report 539.

State Profile of Employment and Unemployment, 1977

Data in this report were obtained primarily from the Current Population Survey (CPS), a sample survey of households conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. Although the CPS was designed initially to obtain reliable statistics for the Nation as a whole, the sample has been increased in recent years to provide reliable labor force estimates for all States and the District of Columbia. However, the State estimates are still subject to a wider range of statistical error than are national data, as explained in appendix A.

Readers should use the data in this report in conjunction with the information on the range of statistical error given in appendix A and error ranges shown in table 1. The chances are 9 out of 10 that the unemployment rate obtained from a complete count of a given population group would fall within the range shown. Error ranges for labor force and employment data can be computed as explained in appendix A. In making comparisons, users should be aware that an apparent change (or difference between two figures) may not be significant when its relative error is considered.

Section I. Unemployment, the Labor Force, and Employment, 1977

Unemployment

Unemployment rates declined in 36 States in 1977, and the national average dropped to 7.0 percent from the 7.7-percent rate of 1976. However, decreases in unemployment rates were significant in only 15 States — 7 of the more populous and 8 of the less populous States (text table 1). The seven populous States (California, New York, New Jersey, Massachusetts, Michigan, Ohio, and Florida) accounted for more than half of the 0.7-percentage-point decline in the national unemployment rate. Smaller States in which there were significant declines included five western States (Arizona, Nevada, New Mexico, Hawaii, and Oregon), two New England States (Connecticut and Vermont) and one southern State (Georgia). Unemployment increased significantly in Alaska and North Dakota, States in which the labor force also increased significantly in 1977.

In both 1976 and 1977, unemployment tended to be least severe in the geographic center of the Nation and in the agricultural States. Nebraska and South Dakota were among the States with the lowest rates in both years. Wyoming replaced North Dakota in 1977 as the third lowest.

Unemployment tended to be most severe near the Nation's boundaries — on the East, West, and Gulf Coasts and along the Mexican border. Three States had unemployment rates significantly above 8.5 percent in 1977: Alaska and New Jersey (both 9.4 percent, the highest in the Nation), and New York (9.1 percent). The District of Columbia's unemployment rate was also over 9 percent. In 1976, 10 States and the District of Columbia had unemployment rates significantly above 8.5 percent. Reference tables 1 through 3 provide detail on unemployment by sex, age, race, occupation, and other characteristics of the unemployed.

Duration of unemployment. In 1976 there were 10 States in which more than 20 percent of the unemployed had been out of work for 27 weeks or more. In 1977, only four States had such a large proportion of long-term unemployed (table 5). Two of these States, New Jersey and New York, were among the three with the highest unemployment rates in the Nation. States with the lowest rates tended to have a smaller proportion of long-term unemployment.

Reasons for unemployment. The unemployed are classified into four groups. Those who have lost their last job through discharge or layoff, those who have left their last job voluntarily, those who have reentered the labor force after a period of separation, and those who are entering the labor force for

[1] Estimates for individual States may not add to regional totals because the sample data for States are controlled to independently derived State population estimates.

p=provisional. Estimates are subject to revision when revised estimates of the population are obtained.

r=revised. The 1976 annual average labor force and unemployment levels are based upon revised population estimates. They supersede estimates published in Geographic Profile of Employment and Unemployment, 1976, Report 452, which were based upon provisional estimates of the population. Unemployment rates do not change as a result of the revised estimates.

* Statistically significant change from 1976 to 1977 (at 90-percent confidence level). See appendix A.

the first time. In 1977, persons who had been discharged or laid off constituted the largest group in every State, but the proportion varied widely (table 6). Job losers made up only one-third of the total in Georgia and Texas but about three-fifths in New York and Rhode Island. In Alaska and New Jersey, the two States with the highest unemployment, and in the District of Columbia, job losers constituted one-half of the unemployed. Alaska had a very small proportion of new entrants to the labor force unemployed, as was true in Idaho, Kansas, and Vermont. On the other hand, about one-fifth of the unemployed in Mississippi, West Virginia, and Wisconsin were new entrants.

Labor force and employment

The labor force increased significantly in 22 States between 1976 and 1977 (text table 1). Only two of these States were on the East Coast — Vermont and New Hampshire. Many of the States in the North Central and South Central regions and three Pacific Coast States had significant labor force gains in 1977.

As in the past, adult men constituted the largest group in the labor force in 1977. Teenagers — nearly 10 percent of the national labor force—varied from about 11-12 percent of the labor force in four Western States (Arizona, Idaho, New Mexico, and Utah) and in five Central States (Michigan, Minnesota, Nebraska, South Dakota, and Wisconsin) to 7-8 percent in Hawaii, New York, and Tennessee.

Employment rose 3.5 percent nationwide in 1977. Gains were significant in 28 States and especially large (over 5 percent) in 13 States. These were in New England (Connecticut, New Hampshire, and Vermont), the mid-South (Arkansas, Kentucky, and Oklahoma), and the West (Arizona, California, Idaho, Nevada, New Mexico, Oregon, and Wyoming). In contrast, employment gains were not significant in most of the industrial States of the East Coast and the Great Lakes region, and in the midwestern farm States.

Occupational distribution. Maryland and the District of Columbia, where the Federal Government and government-related activities are concentrated, had the highest proportion of white-collar employment in 1977, about 60 percent of their total employment (table 4). Three southern States (Arkansas, Mississippi, and West Virginia) had the lowest proportion, about 40 percent. Blue-collar workers made up less than 50 percent of the total employed in every State. The highest proportions of blue-collar workers (between 40 and 50 percent) were in three South Atlantic States (West Virginia, North Carolina, and South Carolina). Only about 25 percent of the workers in Nevada, North Dakota, and South Dakota were in the blue-collar group. North and South Dakota had the highest proportion of workers—about 20 percent—in farm occupations, followed by Iowa and Montana, with about 11 percent. The proportion of workers in service occupations was highest in the District of Columbia, Nevada, and Hawaii—18-24 percent of total employment—probably because the tourist industries, which employ large numbers of cleaning, food service, and personal service workers, are important in these areas.

Racial and ethnic groups

The population was classified by race as "white" or "black and other." Black and other races, nearly 12 percent of the labor force nationwide in 1977, accounted for over one-third of the labor force in Mississippi and about one-fifth in five other southern States (Alabama, Georgia, Louisiana, North Carolina, and South Carolina). In the District of Columbia about three-fourths were of black and other races, as was true in Hawaii. (Included in this racial category are Asians and Pacific Islanders, and also Alaskan natives and American Indians.) Many States outside the South had large numbers but relatively small proportions of black and other workers. California, with 1.2 million, had the largest number of these workers in the labor force, followed by New York, with nearly 1 million, and Illinois, with over 600,000.

Unemployment rates were significantly higher for black and other workers than for white workers in nearly every State in which the black and other category was large enough to permit separate computation (text table 2). Hawaii and Arizona were the exceptions — in Hawaii the unemployment rate for black and other races, at 7 percent, was more than 2 percentage points below the rate for whites, and in Arizona the rates were about the same. (The error range of unemployment rates for black and other workers is very wide in most States because of the small proportion of the population in this category.) Unemployment rates for white workers ranged from less than 4 percent in some midwestern farm States to more than 8 percent in several of the Northeastern, Mid-Atlantic, and Pacific States.

CPS data for *persons of Hispanic origin* are available for selected States for the first time in this report. Estimates are shown in text table 3 for five States for which reliable data are available (California, Florida, Illinois, New York, and Texas) and for a combined three-State area (Arizona, Colorado, and New Mexico) where this ethnic group is most con-

centrated. It should be noted that data on persons of Hispanic origin are tabulated here without regard to race but are included in the appropriate racial category—"white" or "black and other"—in the data classified according to race. In the 1970 Census of Population approximately 97 percent of the Hispanic-origin population was classified as white.

In 1977, about 13-15 percent of the labor force of California, Texas, and the three-State area of Arizona, Colorado, and New Mexico were of Hispanic origin. About 1.4 million in California, 900,000 in Texas, and 500,000 in New York State were of this population group. In every State with sufficient numbers to permit separate computation, Hispanic workers had higher unemployment rates than white workers but lower rates than black and other workers. (Although error ranges for the unemployment rates of the Hispanic-origin population are not available, it is likely that data for this population group have at least as large a sampling error as data for the same size group of black and other workers.)

Men, 20 years and over	124	106	85.5	103	3	2.8	2.1 - 3.5
Women, 20 years and over	125	64	51.2	61	2	3.1	2.3 - 3.9

[1] Error ranges are shown at the 90-percent confidence interval, which means that, if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases, the true value based on a complete census of the population would be contained within these error ranges.

NOTE: Items may not add to totals because of rounding. Data for demographic groups not shown where the labor force estimate does not meet BLS standards of reliability (see appendix A).

Table 2. Full- and part-time status of the civilian labor force 16 years and over by State, 1977 annual average

(Numbers in thousands)

State	Full-time labor force					Part-time labor force			
	Total	Employed		Unemployed (looking for full-time work)		Total	Employed on voluntary part time	Unemployed (looking for part-time work)	
		Full-time schedules	Part time for economic reasons	Number	Percent of full-time labor force			Number	Percent of part-time labor force

[1] Data for occupational categories are not shown where the labor force estimate does not meet BLS standards of reliability (see appendix A).

[2] Estimates are not shown where there are less than 500 persons employed or unemployed or where the unemployment rate is less than 1.0 percent.

NOTE: Items may not add to totals because of rounding. Unemployed persons with no previous work experience are not shown but are included in total. Unemployment rates shown were calculated using unrounded data.

Section II. Monthly Unemployment Rates

This section presents monthly unemployment rates by State. Table 7 provides monthly rates for 10 large States for 1970-77, based directly on the Current Population Survey. Table 8 provides monthly rates for the remaining 40 States and the District of Columbia for 1976-77, based on a composite estimating methodology explained below and in appendix B.

The monthly unemployment rates shown in table 7 for the 10 large States (California, Florida, Illinois, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Texas) are taken directly from the Current Population Survey (CPS)—the monthly survey of households used to measure national unemployment. These are the only States for which the monthly CPS data meet the BLS standard of reliability—a relative error of 10 percent or less at 1 standard error when the unemployment rate is 6 percent. This means that, if repeated samples were conducted in the area and an error range constructed around each, the actual rate based on a complete census of the population would be contained in these error ranges 68 percent of the time. For an unemployment rate of less than 6 percent, the relative error is larger than 10 percent since the unemployed constitute a smaller proportion of the population. For an unemployment rate over 6 percent, the relative error is smaller.

Except for these 10 large States, the size of the current CPS sample is not sufficient to obtain reliable monthly State estimates. Therefore, statistics derived from unemployment insurance (UI) operations, as well as adjustment factors from the CPS and other sources, are used to calculate estimates for the remaining 40 States and the District of Columbia. Annual average data from the CPS which meet the 10-percent test of variation are used to control the estimates obtained from the UI-based procedure. Table 8 contains monthly unemployment rates only for 1976-77. The monthly figures are "benchmarked" to the CPS annual averages for these years. Annual CPS benchmarks prior to 1976 are not available for all 40 States.

Because of the manner in which the estimates for the 40 States and the District of Columbia have been developed, it is not possible to produce measures of reliability. However, the monthly figures incorporate both sampling variability (because of the use of the CPS annual average benchmark) and other measurement errors which stem primarily from the estimating techniques used for the initial UI-based estimate. Consequently, the monthly estimates for the 40 States and the District of Columbia are subject to greater margins of error than those for the 10 States which are based directly on the monthly CPS.

For a more complete description of the estimating methodology, see appendix B. For a further discussion of sampling variability, see appendix A.

[1] Monthly estimates for these States are obtained from the Federal-State Cooperative Program and are adjusted to annual averages from the Current Population Survey.

Appendix A. Reliability of Estimates and Sampling Error Tables

CPS sample design

The estimates presented in section I of this report are based on the Current Population Survey (CPS)—a sample of the population rather than a complete count. Consequently, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures as for the sample. In general, the relative error of a sample estimate varies inversely with the size of the sample and the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of the population within an area will tend to have a relatively larger error than an estimate for a subgroup constituting a large proportion of the population within that area.

The CPS was initially designed to provide reliable monthly national statistics. Before 1976, State estimates which met minimum standards of reliability on an annual basis could be obtained for only 27 large States. Samples were supplemented in the 23 smaller States and the District of Columbia (some 9,000 households were added to the survey) so that reliable annual estimates of unemployment could be obtained for all States in 1976. As a result, the sampling error for an estimate of a given size generally will be lower in the 23 States (and the District of Columbia) in which the CPS sample was supplemented than in the 27 large States which were part of the original sample. Therefore, an estimate of 50,000 unemployed persons in California for a particular population group has a sampling error of 8,000, while in Delaware, an unemployment estimate for a population group of the same size has a sampling error of 4,000 at 90-percent confidence (table A-1).

The chances are 9 out of 10 that the estimate from the survey differs from a complete census figure by less than the sampling error. The 90-percent confidence sampling error used in this report is 1.645 times the standard error of the sample estimate.

The amount of detail which is published in this report depends on the size of the sample relative to the population in each State. For the 27 large States, estimates are not shown where the labor force for a particular demographic group is less than 50,000. In the 23 smaller States and the District of Columbia, where the sample was supplemented, this criterion is reduced to 25,000. This guideline is also used to determine whether the unemployment rate for a specific occupational group is shown in table 3.

Using the sampling error tables

Tables of sampling error make it possible to compute the relative error—the sampling error divided by the sample estimate—and to compare two sample estimates by means of a statistical test of significance. The tables provide an indication of the order of magnitude of the sampling error rather than a precise measure of error.

The error tables relate directly to the annual average estimates shown in section I. The error associated with monthly unemployment estimates for the 10 large States in table 7 of section II, which are based on the CPS, is approximately 2.2 times greater than for annual data. The error tables are not applicable to monthly unemployment estimates for the 40 States and the District of Columbia in table 8, which are obtained from the Federal-State cooperative program and controlled to annual averages from the CPS. Measures of the variation associated with these data have not been developed, and use of the sampling error tables for these estimates would be inappropriate.

The error tables can be used directly to develop 90-percent confidence intervals for sample estimates. For example, table A-1 shows that an estimate of 50,000 unemployed persons in Alabama for a particular population group will have a sampling error of 8,000, while an estimate of 400,000 unemployed persons for another population group in the same State has a sampling error of 22,000. In the first instance, the relative error is 16 percent (8,000 ÷ 500,000 = 16.0 percent), and in the latter, the relative error is less than 6 percent (22,000 ÷ 400,000 = 5.5 percent).

For a 68-percent confidence interval, (2 chances out of 3) the range should be multiplied by 0.6; for 95 percent (19 chances out of 20), 1.19 should be used. Table A-1 indicates that the error at 90-percent confidence for 50,000 unemployed persons in Alabama is 8,000 (9 chances out of 10). At 68-percent confidence the error would be about 5,000 (8,000 x 0.6 = 4,800). At 95-percent confidence (19 chances out of 20), the error would be about 10,000 (8,000 x 1.19 = 9,520).

To compute the error of a difference from the tables, an additional step is required. For instance, one may wish to know whether the change in the unemployment rate from 1976 to 1977 in a particular State is statistically "significant," or whether differences in the unemployment rates of two States or

population groups should be regarded as statistically meaningful.

To test for the significance of a difference, the following formula should be used:

$$z = \sqrt{a^2 + b^2 - C}$$

where a = the error of one group or year
b = the error of another group or year
C = the covariance (or relationship) between a and b
z = the error of the difference

Estimates for the "C" term at the State level are not available. If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated. An example will illustrate how this test is applied. Suppose one wished to ascertain whether the change in the unemployment rate in Arizona from 9.8 percent to 8.2 percent between 1976 and 1977 was statistically significant. Arizona's labor force was about 950,000 in both years. For purposes of illustration, the 1,000,000 labor force line in table A-5 will be used to test for significance. The table gives the error for an 8.0-percent unemployment rate as 0.85 and for a 10.0-percent rate as 0.93. Using the formula described above, the following would result:

$$a = 0.85$$
$$b = 0.93$$
$$a^2 + b^2 = 1.59$$
$$\sqrt{1.59} = 1.26$$

Assuming a negligible "C" term, the error of the difference is 1.3. Since the actual change (1.6) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error.

To derive a more precise sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table A-1 contains no sampling error for an estimate of 750,000. The following formula shows how to interpolate for an estimate of 750,000 for California:

$$Z = \left[(C-B) / (A-B)\right] \times (X-Y)\right] + Y$$

where:
A = published size immediately above the size desired, 800,000
B = published size immediately below the size desired,, 600,000
C = size desired, 750,000
X = error of A, 29,000
Y = error of B, 26,000
Z = error of C, 28,250

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "A" term is the highest value in the table and the "B" term becomes the next highest value.

Error tables in this publication supersede error tables in *Geographic Profile* reports for 1974-76. In late 1973, the Bureau of the Census introduced a new procedure for inflating sample estimates on a State basis. This procedure improved the estimates of employment and unemployment at the State level. Therefore, State estimates for 1974 and later years generally will be subject to a smaller range of error than those before 1974. For the earlier years, standard errors appearing in the reports for those years should be used.

Appendix B. Procedures for Estimating Employment and Unemployment for States

Data sources

Employment and unemployment estimates for the 10 large States — New York, California, Illinois, Ohio, New Jersey, Pennsylvania, Michigan, Texas, Massachusetts, and Florida—are taken directly from the Current Population Survey (CPS). For a description of CPS concepts, see the BLS periodical *Employment and Earnings*, Explanatory Note A, "Household Data."

Estimates for the remaining 40 States and the District of Columbia are prepared by State employment security agencies under standardized procedures developed by the Bureau of Labor Statistics. The estimates are prepared in several stages, as explained below.

Preliminary estimate—employment

The total employment estimate is based primarily on data from the survey of establishments which produces an estimate of payroll employment. This place-of-work estimate must be adjusted to refer to place of residence as used in the CPS. Factors for adjusting from place of work to place of residence have been developed for the major categories of employment by class of worker and industry on the basis of employment relationships which existed at the time of the 1970 Decennial Census. These factors are applied to the payroll employment estimates for the current period to obtain adjusted employment estimates.

Preliminary estimate—unemployment

In the current month, the estimate of unemployment is an aggregate of the estimates for each of three categories: (1) Persons who were previously employed in industries covered by State UI laws; (2) those previously employed in industries not covered by these laws; and (3) those who were either entering the labor force for the first time or reentering after a period of separation. This is referred to below as the UI-based estimate.

An estimate for those previously employed in covered industries is derived from a count of current unemployment insurance claimants, plus estimates of claimants whose benefits have been exhausted, those persons disqualified from receiving benefits for nonmonetary reasons (because they quit, were discharged for cause, etc., but would otherwise have been eligible), and persons who either filed claims late or not at all.

The estimate of those previously employed in industries not covered by UI is derived by applying to the employment estimate for each noncovered industry or class of worker subgroup in the State the ratio of covered unemployment to covered employment, weighted by factors reflecting national historical relationships.

For the third category, new entrants and reentrants into the labor force, a composite estimate is developed from equations that relate the total entrants into the labor force to the experienced unemployed and the experienced labor force. For each month, the estimate of entrants into the labor force is a function of: (a) The month of the year; (b) the level of the experienced unemployed; (c) the level of the experienced labor force; and (d) the proportion of the working-age population that is considered "youth." The composite estimate of total entrants is defined as:

$U = A(X+E) + BX$, Where

U=total entrant unemployment
E=total employment
X=total experienced unemployment
A,B=synthetic factors incorporating seasonal variation and an assumed relationship between the proportion of youths in the working population and the historical relationship of entrants to the experienced unemployed (B factor) or the experienced labor force (A factor)

Correction factors

Correction factors are then applied at the State level to the UI-based estimates obtained above for each of the 40 States and the District of Columbia. These correction factors are based on the ratio of the CPS to the UI-based estimates for the 6-month period ending in the current month (e.g. a 6-month moving average).

Benchmark correction procedures

Once each year monthly estimates prepared by State employment security agencies using UI-based estimating procedures are adjusted, or benchmarked, by BLS to the annual average CPS estimates for the 40 States for which monthly CPS estimates are not

available. This adjustment is necessary because the State-prepared estimates are not as reliable as the CPS annual averages due to differences in State UI laws, the structural limitations of the UI-based estimating method, and errors in the UI data.

The benchmarked estimates are produced in three stages. First, the monthly UI-based estimates are adjusted by the ratio of the CPS to the UI-based annual averages. Second, the difference between the ratio of annual averages for 2 consecutive years is wedged into the monthly estimates in order to minimize the disturbance to the original series. Finally, the second-stage estimates are forced into agreement with CPS annual averages. In the 10 States which use CPS estimates monthly, no benchmark correction is required, as the average of the 12 monthly State CPS estimates will equal the CPS annual averages.

Geographic Profile of Employment and Unemployment: States, 1978 Metropolitan Areas, 1977-78

U.S. Department of Labor
Bureau of Labor Statistics
September 1979

Report 571

U.S. DEPARTMENT OF LABOR
Ray Marshall, Secretary

Bureau of Labor Statistics
Janet L. Norwood, Commissioner
September 1979

Preface

This report is the latest in a series presenting labor force data for States, large metropolitan areas, and central cities from the Current Population Survey. It provides 1978 annual average demographic and economic characteristics of the labor force in the States and similar data for 30 large Standard Metropolitan Statistical Areas and 11 large cities in 1977 and 1978. Demographic and economic characteristics of the labor force for 1977 for the 50 States may be found in *State Profile of Employment and Unemployment, 1977,* Report 539. For the States, metropolitan areas, and cities in earlier years, these estimates are published in the following reports: "Regional Differences in Employment and Unemployment, 1957-72," *Monthly Labor Review,* March 1974; *Characteristics of Workers in Large States and SMSA's--1970* (Report 388); *Employment in Perspective: Regional Aspects of Unemployment, 1969-70* (Report 395); *Geographic Profile of Employment and Unemployment, 1971* (Report 402); *1972* (Report 421); *1973* (Report 431); *1974* (Report 452); *1975* (Report 481); and *1976* (Report 504).

The official BLS estimates presented in section V are developed from a Federal-State cooperative program and are used in the administration of Federal fund allocation programs. However, the data from the Current Population Survey (CPS) for metropolitan areas and cities shown in sections III and IV are also used in administration of certain legislation, such as section 202 (F) (2) (B) of the Comprehensive Employment and Training Act Amendments of 1978.

Material in this publication is in the public domain and may be reproduced without the permission of the Federal Government. Please credit the Bureau of Labor Statistics and cite *Geographic Profile of Employment and Unemployment,* Report 571.

This report was prepared in the Office of Employment Structure and Trends, Division of Local Area Unemployment Statistics, by Russ Marshall, Anderia Thomas, and Richard Rosen, with the assistance of Harold Biagas. Technical assistance was provided by Denis Keyes and Sandy Grove, under the supervision of Fred Cronkhite. Overall direction was provided by Sylvia Small.

Definitions of Data Based on the Current Population Survey

Tables on labor force status in sections I-IV include provisional estimates of the civilian noninstitutional population 16 years and over, as well as data on the civilian labor force (the total of the employed and the unemployed), unemployment rates, and labor force participation rates. Population estimates are revised by the U.S. Bureau of the Census each year. The revised population estimates are incorporated into the CPS labor force levels used in the Federal-State Cooperative Program. This adjustment affects the estimates of labor force, employment and unemployment but does not affect unemployment rates, participation rates, or employment-population ratios.

Employment includes all persons who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid family workers. Persons temporarily absent from a job because of illness, bad weather, strikes, or for personal reasons are counted as employed whether or not they were paid by their employer and whether or not they were seeking other jobs.

Unemployment is the number who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons on layoff, waiting to be called back to a job, and those waiting to report to a new job within the next 30 days are also counted as unemployed.

Hispanic origin refers to persons who identify themselves in the survey as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin. Hispanics are included among both the white and "black and other" groups. According to the 1970 Census, about 96 percent of the Hispanic population classified themselves as white. Estimates of sampling errors are not available for the Hispanic population for States and SMSA's. Except in the Miami area, the Hispanic population is smaller than the black and other population, and estimates for this group are likely to have a wider error range. Therefore, caution should be exercised in using these data.

Most of the people in the labor force work full time, and most of the unemployed are looking for full-time work. *The full-time labor force* consists of persons working on full-time schedules, persons involuntarily working part time (employed part time for economic reasons), and unemployed persons seeking full-time jobs. *The part-time labor force* consists of the total of persons working part time voluntarily (1-34 hours), and unemployed persons seeking part-time work.

Estimates for the full- and part-time labor force are shown for the States and the 30 SMSA's. However, **because of the small number of persons of black and other races in these areas, reliable data for the black and other population are available for only 22 of the 30 SMSA's.**

Occupational data are arranged according to the 10 major categories defined in the 1970 Census. The occupation of the employed refers to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more.

Employment, unemployment, and the unemployment rate are shown for each of the States and the 30 large metropolitan areas for each occupational category. Data are not shown where the numbers are too small to yield reliable estimates. In tables showing data for cities, occupational groups have been combined in order to improve the quality of the estimates.

Duration of unemployment—the length of time it takes an individual worker to find a job—is closely related to the unemployment rate. A large proportion of short-term unemployment in an area indicates that the labor force is being quickly absorbed into employment, and the overall rate is usually lower than in places where large numbers are unemployed for long periods. Unemployment in each area is distributed according to the length of time unemployed persons had been continuously looking for work during an average month of 1978.

The percent of the unemployed with short-term unemployment—less than 5 weeks or about 1 month—is contrasted with the percent unemployed 5-14 weeks, 15-26 weeks, and longer, including those unemployed for more than 1 year. Data are available for men, women, and white workers for all States, 30 SMSA's, and 11 large cities. However, because of the small size of the population of black and other races, publication of estimates of the duration of unemployment for this **group has been limited to 14 States and 6 SMSA's.** Estimates are not published in categories where there are fewer than 500 persons unemployed.

Reasons for unemployment are divided into four major groups: (1) Job losers—persons whose employment ended involuntarily who immediately began looking for work, and persons on layoff; (2) job leavers—persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) reentrants—persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) new entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

Total unemployment is distributed among the four categories by sex. The data have not been disaggregated by race and are not currently available for cities.

A more detailed description of the concepts used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey*, BLS Report 463.

Geographic Profile of Employment and Unemployment

Data about unemployment in States and sub-State areas are available from two major sources--the Current Population Survey (CPS) and the Federal-State Cooperative Program.

The CPS is the regular monthly survey of about 56,000 households from which the national unemployment rate is derived. Annual average estimates of the demographic characteristics of the labor force (age, sex, and race) and the economic characteristics of the employed and unemployed which meet publication standards are available for the 50 States, 30 large Standard Metropolitan Statistical Areas (SMSA's), and 11 large cities. Estimates for these areas are shown in sections I, II, III, and IV. Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling errors. Error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections II, III, and IV. In addition, appendix A provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections. Sections I and II refer to the demographic and economic characteristics of workers in the 50 States and the District of Columbia in 1978. Sections III and IV include similar data for 30 large SMSA's and 11 large cities in 1978 and 1977.

The Federal-State Cooperative Program provides monthly and annual average labor force and unemployment estimates for the 50 States and for 214 major labor market areas (section V.) These estimates are largely based upon administrative statistics from the unemployment insurance system, adjusted to conform to CPS annual estimates for the States. For the 10 largest States both the monthly and annual estimates are obtained from the CPS. Appendix C describes the procedures for estimating employment and unemployment under this program.

Section I. Review of Demographic Changes in the States in 1978

Labor force

In 1978, the national civilian labor force exceeded 100 million persons for the first time. One-fourth of this total lived in the three largest States. California led with 10 percent of the U.S. labor force; New York was second, with 8 percent; and Texas followed, with 6 percent (table 1).

The national civilian labor force grew by 3.1 percent between 1977 and 1978, a very sharp gain compared with an average growth rate of about 2.5 percent in the preceding 10 years; much of the growth over the year was concentrated in two of the three largest States--California and Texas--and in Florida. The 1978 increase in the labor force was particularly sharp in California and Florida, where gains were about 5 percent. Although they represented a smaller number, there were relatively large labor force gains in several Western and Mountain States between 1977 and 1978, with increases exceeding 5 percent in Montana, Oregon, Washington, and Wyoming. On the other hand, there was very slow growth (less than 1 percent) or a labor force decline in three New England States--Connecticut, Maine, and Rhode Island--and in Mississippi and Hawaii.

Nationally, the female labor force grew much faster than the male labor force between 1977 and 1978--4.8 percent compared with 1.9 percent. The number of women in the labor force increased in all except three States--Delaware, Rhode Island, and Hawaii. Increases for women ranged as high as 7-12 percent in nine States (Alaska, Kansas, Minnesota, Montana, Nebraska, Oklahoma, Vermont, Wisconsin, and Wyoming).

In Montana and Wyoming, gains in the male labor force were also very sharp, about 5 percent, but not as sharp as for women, for whom the gain was 12 percent. Only 8 States had a larger growth rate for men than for women--most notably Louisiana, Nevada, and New Mexico. Elsewhere, the increase was from 1 to 9 percentage points higher for women than for men.

The 1977-78 increase in the labor force included both young people and adults, but the size of the increase for each of these groups varied considerably among the States. Of the 47 States for which data for teenagers are pub-

lished, 8 had teenage gains as large as 10 percent between 1977 and 1978--Arkansas, Florida, Iowa, Kentucky, Louisiana, Montana, New Hampshire, and Oregon. The national teenage labor force increased about 3 percent, and a total of 27 States widely scattered throughout the Nation had increases at least this large. However, except for New Hampshire and New Jersey the teenage labor force did not grow significantly in any Northeastern States, and in 10 States, including Rhode Island and Connecticut, the teenage labor force declined.

In States where data for "black and other" races are shown separately, their labor force growth has been much larger, relatively, than that of whites in all except seven States--Alabama, Connecticut, Delaware, Georgia, Hawaii, Indiana, and Kentucky.

Three of the five States for which separate estimates are available for the Hispanic population showed much larger Hispanic labor force growth than was the case among either the white or the black and other races. Only in New York and Florida was the increase in the number of Hispanics in the labor force raltively smaller than the increase among black and other races (table 2).

Demographic shares of the labor force. Despite gains of other demographic groups, the labor force was still predominantly male and white in most States in 1978.

Teenagers accounted for close to 10 percent of the labor force in most States.

The labor force share accounted for by minorities varied more widely: Those of black and other races were a very small proportion in the northern tier of States (from New England, New York, and the North Central Farm Belt to the Northwestern States), but continued to be as much as one-sixth to one-third of the labor force in the Southeastern and South Central States. However, their largest share was in Hawaii, where three-quarters of the labor force in 1978 were in this group. (The black and other group includes Asians, Pacific Islanders, Alaskan natives, and American Indians as well as black persons.) Most persons of Hispanic origin are included among the white labor force; in the five States where they are also separately counted, they ranged from 4 percent of the labor force in Illinois to about 17 percent in Texas.

Employment

Employment expanded rapidly in all States except Hawaii in 1978. In three-fourths of the States, employment gains were larger than labor force gains, resulting in a drop in the number of unemployed. In five States--Alaska, Arkansas, Nebraska, North Dakota, and Virginia--the number of employed men dropped between 1977 and 1978. However, increases in the number of employed women in these States more than offset these declines, so that total employment increased (although relatively less than the national gain of 4.2 percent). The largest employment gains--6 percent or more--were concentrated in the Pacific and Mountain States (California, Oregon, and Washington; Montana, Nevada, New Mexico, and Wyoming), and in Florida and New Hampshire.

In most States, the employment-population ratio--the percent of the working age civilian noninstitutional population with a job--increased between 1977 and 1978

Text table 1. Employment-population ratios[1] by State, 1977 and 1978 annual averages

State	1977	1978	State	1977	1978
Alabama	54.0	55.5	Missouri	59.2	59.7
Alaska	63.2	63.5	Montana	59.1	61.7
Arizona	55.4	55.8	Nebraska	64.5	65.8
Arkansas	55.3	54.8	Nevada	66.2	67.4
California	58.4	60.5	New Hampshire	62.8	64.7
Colorado	62.9	63.7			
Connecticut	60.5	61.7	New Jersey	56.4	58.4
Delaware	58.8	59.3	New Mexico	57.0	59.1
District of Columbia	58.3	60.7	New York	53.0	54.6
Florida	50.8	52.9	North Carolina	62.8	64.2
			North Dakota	60.5	60.7
Georgia	59.5	60.9	Ohio	57.8	59.4
Hawaii	63.8	61.9	Oklahoma	57.3	57.9
Idaho	61.5	62.3	Oregon	59.5	61.7
Illinois	60.0	61.0	Pennsylvania	54.1	55.2
Indiana	60.4	62.2	Rhode Island	58.0	57.8
Iowa	63.2	63.9			
Kansas	63.4	65.2	South Carolina	60.1	60.6
Kentucky	58.2	58.6	South Dakota	62.9	64.6
Louisiana	53.8	54.5	Tennessee	57.0	56.9
Maine	55.3	56.3	Texas	60.9	62.1
			Utah	59.9	60.3
Maryland	61.0	63.2	Vermont	60.5	62.7
Massachusetts	59.5	61.5	Virginia	62.1	62.6
Michigan	57.7		Washington	56.8	59.7
Minnesota	63.3	65.5	West Virginia	47.2	49.1
Mississippi	54.6	54.3	Wisconsin	62.4	63.8
			Wyoming	65.0	67.0

[1] Percent of the working age civilian noninstitutional population employed.

(text table 1). However, in five States growth in the working age population exceeded employment gains, so that the E/P ratio declined slightly.

About two-thirds or more of the working age population had jobs in Kansas, Minnesota, Nebraska, Nevada, and Wyoming. By of contrast, only about half had jobs in Florida, where many retired and edlerly persons reside. In West Virginia, the E/P ratio was also low--below 50 percent--reflecting the small proportion of working age women with jobs (33 percent).

Full- and part-time employment. The gain in employment in a majority of the States was predominantly among full-time workers in 1978, while the number employed part time grew more slowly or declined. Seven of the ten major industrial States were among those with large gains in full-time employment. In California, Massachusetts, Ohio, and Texas, gains in full-time employment were accompanied by smaller relative increases in the number of part-time workers; in Michigan, New Jersey, and Pennsylvania, the number employed part time fell while those employed full time increased, indicating a shift toward full-time work as the business cycle recovery continued in these States (table 3).

Occupational changes. In 20 States--primarily on the East Coast--the number of white-collar jobs grew faster than the number of blue-collar jobs between 1977 and 1978, while nationally gains were about the same for both occupational groups--about 4.5 percent. White-collar job gains were sharper than blue-collar gains in seven of the biggest industrial States, including Massachusetts, New Jersey, New York, Pennsylvania, Florida, Michigan, and California. However, in most of the industrial North Central and South Central States, growth in blue-collar employment was relatively larger than in white-collar employment. There were only six States where the number of blue-collar jobs declined--three in New England (Connecticut, Maine, and Rhode Island), and Georgia, Hawaii, and Virginia. In several other States, although the number of nontransport operatives fell, there were offsetting increases in other blue-collar jobs (table 4).

Service occupations had smaller gains, nationally, than either the white-collar or blue-collar groups, rising only 3.6 percent from 1977 to 1978; but gains were over 10 percent in four Western and two Southern States--Arizona, Maryland, Nevada, New Mexico, Tennessee, and Utah--and higher than the national average in an additional 15 States, primarily along the East Coast and in the North Central region. However, in 14 States, the number of workers in service occupations fell by at least 2 percent.

Differences in occupational distribution of employment. White-collar workers--about half of the employed workers in the United States--accounted for 55 percent or more of total employment in seven States in 1978 (Alaska, Arizona, California, Connecticut, Maryland, New Jersey, and New York). Maryland had the largest proportion of white-collar employment of any State (59 percent), reflecting commuters into the Federal establishment in the District of Columbia.

West Virginia had the largest proportion of blue-collar workers, primarily mining and nontransport operatives. Other States with large proportions of blue-collar workers included Alabama, Indiana, Mississippi, North Carolina, South Carolina, and Tennessee. In these States about 4 in every 10 workers held blue-collar jobs in 1978 (table 5).

Unemployment

Unemployment rates declined in most States between 1977 and 1978 as the national unemployment rate dropped 1 full percentage point (from 7.0 to 6.0 percent). Decreases were particularly sharp (2 percentage points or more) in five Northeastern States (Maine, Massachusetts, New Hampshire, Rhode Island, and New Jersey) and in four Western States (Arizona, Nevada, New Mexico, and Washington).

The lowest unemployment rates in the Nation were in three midwestern farm States--Nebraska, Kansas, and South Dakota--and in Wyoming. In each of these States less than 3.5 percent of the labor force were unemployed in 1978. Alaska's unemployment rate (11.2 percent) continued to be the highest of any State in 1978 followed by Hawaii and New York (both 7.7 percent). (See chart 1.)

Racial and ethnic groups. Unemployment rates for white and for black and other workers declined in most States from 1977 to 1978. However, unemployment rates for black and other workers remained well above those for white workers in all States except Hawaii (where the black and other category is composed largely of Asians and Pacific Islanders). Unemployment rates for white workers ranged from 2.6 percent in three Midwestern States to over 9 percent in Alaska and Hawaii. For black and other workers, rates of unemployment ranged from 7.2 percent in Hawaii to over 17 percent in Pennsylvania and Alaska (where the black and other category includes large numbers of native Alaskans). Nationally, unemployment rates were 5.2 percent for whites and 11.9 percent for persons of black and other races in 1978, down 1.0 and 1.2 percentage points, respectively, from 1977.

Workers of Hispanic origin shared in the improved employment picture in 1978. Data for Hispanic workers are currently available for five States and for the combined three-State area of Arizona, Colorado, and New Mexico. Hispanic unemployment rates declined in four of these five States and in the combined three-State area. The national unemployment rate for this group dropped from 10.1 percent in 1977 to 9.1 percent 1978.

Chart 1. Unemployment Rates by State, 1978 Annual Averages

Reasons for unemployment. The most common factor triggering unemployment was loss of a job rather than voluntarily leaving a job or entering the labor force. In most States 30-40 percent of all unemployed persons were job losers. However, nearly one-half of all unemployed persons had lost their jobs in California (46 percent), Massachusetts (45 percent), Nevada (47 percent), New Jersey (51 percent), and Pennsylvania (46 percent).

About one in every six to eight unemployed persons in most States had left a job voluntarily, but about one in every five had quit their last job in Arizona, Florida, Idaho, Kansas, Nevada, Oklahoma, Oregon, and Texas.

New entrants and reentrants to the labor force made up the remaining unemployed. Mississippi had the largest proportion of new entrants to the labor force, 21 percent, while Oklahoma had the largest share of reentrants, 45 percent (table 7).

Duration of unemployment. Over 10 percent of the unemployed in New York State had looked for a job for 52 weeks or more, on the average, in 1978, while one-third had looked for only 5 weeks. By contrast, in 22 States, more than half the unemployed had looked for work for less than 5 weeks. The State with the largest share of short-term unemployment was Wyoming where about two-thirds of the unemployed looked for work for less than 5 weeks (table 6).

Section II. State Estimates From the Current Population Survey, 1978 Annual Averages

Table 1. Labor force status of the civilian noninstitutional population 16 years and over by State, sex, age, and race, 1978 annual averages

(Numbers in thousands)

State and population group	Civilian noninstitutional population	Civilian labor force		Employment	Unemployment		
		Number	Percent of population		Number	Rate	Error range of rate[1]
Alabama							
Total	2,687	1,592	59.2	1,492	101	6.3	5.5 - 7.1
Men	1,279	962	75.2	915	47	4.9	4.0 - 5.8

[1] Error ranges are shown at the 90 percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

According to the 1970 census, black workers constituted about 89 percent of the black and other population group for the Nation. However, the proportion of black workers in the black and other population varies within each State. For instance, in the State of North Carolina, the black and other category is comprised mostly of black workers. In the State of Hawaii, the black and other category is composed largely of Asians and Pacific Islanders.

NOTE: Items may not add to totals because of rounding. Data for demographic groups are not shown when they do not meet BLS standards of reliability for the particular State based on the sample in that State. See appendix A.

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS standards of reliability for the particular State, based on the sample in the State. See appendix A.

NOTE: Numbers may not add to totals because of rounding.

Table 4. Labor force status by occupation and State, 1978 annual averages

(Numbers in thousands)

State	Total	White-collar workers					Blue-collar workers					Service workers	Farm workers
		Total	Professional and technical	Managers and administrators, except farm	Sales workers	Clerical workers	Total	Craft and kindred workers	Operatives, except transport	Transport equipment operatives	Nonfarm laborers

[1] Data are not shown when they do not meet BLS standards of reliability for the particular State, based on the sample in that State. See appendix A.

[2] Estimates are not shown where there are less then 500 persons employed or unemployed.

[1] Less than 1.0 percent.

NOTE: Items may not add to totals because of rounding. Unemployed persons with no previous work experience are not shown separately but are included in total. Unemployment rates shown were calculated using unrounded data.

Table 5. Occupational distribution of employment by State, sex, and Hispanic origin, 1978 annual averages

(Percent of total employed)

State	Total employed	White-collar workers					Blue-collar workers					Service workers	Farm workers
		Total	Professional and technical	Managers and administrators, except farm	Sales workers	Clerical workers	Total	Craft and kindred workers	Operatives, except transport	Transport equipment operatives	Nonfarm laborers		
	Total

(1) Less than 500 persons employed unless than 1.0 percent of total employed. Data for these 3 States were combined to obtained more reliable estimates.

NOTE: Totals may not add to totals because of rounding. Data are not shown separately for black and other races when the employment estimate for black and other races is not sufficiently large to meet BLS standards of reliability for the particular State based on the sample size in that State. See appendix A.

Table 6. Unemployed persons by duration of unemployment by State, sex, and race, 1978 annual averages

Women	191	118	61.8	107	10	8.8	6.8 - 10.8
Men, 20 years and over	148	113	76.4	103	10	8.8	6.8 - 10.8
Women, 20 years and over	175	113	64.6	104	8	7.1	5.2 - 9.0

[1] All areas in this table conform to 1973 geographic boundary definitions. See appendix B.

[2] Error ranges are shown at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases, the true value based on a complete census of the population would be contained within these error ranges.

[3] According to the 1970 Census of Population, black workers constituted about 89 percent of the "black and other" population group for the Nation. However, the proportion of black workers in the black and other population varies among areas.

NOTE: Items may not add to totals because of rounding. Data for demographic groups are not shown when they do not meet the BLS standard of reliability for the particular area, based on the sample size in that area. See appendix A.

[1] Data are not shown when they do not meet BLS standards of reliability for the particular area, based on the sample in that area. See appendix A.

[2] Estimates are not shown where there are less than 500 persons employed or unemployed.

[3] Less than 1.0 percent.

NOTE: Items may not add to totals because of rounding or because farm workers are not shown separately. Unemployed persons with no previous work experience are not shown separately but are included in totals. Unemployment rates were calculated using unrounded data.

[1] Less than 1.0 percent.

[2] Data are not shown separately for black and other races where the employment estimate for black and other races is not sufficiently large to meet BLS standards of reliability for the particular area based on the sample size in that area. See appendix B.

[3] These data for the Hispanic origin population are based on the 1970 geographic boundary definitions for the Houston and New York SMSA's.

NOTE: Items may not add to totals because of rounding.

Table 14. Occupational distribution of employment in 11 large cities by sex and race, 1978 annual averages

(Percent of total employed)

City	Total employed	White-collar workers					Blue-collar workers					Service workers
		Total	Professional and technical	Managers and administrators, except farm	Sales workers	Clerical workers	Total	Craft and kindred workers	Operatives except transport	Transport equipment operatives	Nonfarm laborers

Women, 20 years and over	182	111	61.0	101	9	8.1	6.5 - 9.7

[1] All areas in this table conform to 1973 geographic boundary definitions. See appendix B.

[2] Error ranges are shown at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases, the true value based on a complete census of the population would be contained within these error ranges.

[3] According to the 1970 Census of Population, black workers constituted about 89 percent of the "black and other" population group for the Nation. However, the proportion of black workers in the black and other population varies among areas.

NOTE: Items may not add to totals because of rounding. Data for demographic groups are not shown when they do not meet BLS standards of reliability for the particular area, based on the sample size in that area. See appendix A.

[1] Less than 1.0 percent.

[2] Data are not shown separately for black and other races when the employment estimate for black and other races is not sufficiently large to meet BLS standards of reliability for the particular area based on the sample size in that area. See appendix A.

[3] These data for the Hispanic-origin population are based on the 1970 geographic boundary definitions for the Houston and the New York SMSA's.

NOTE: Items may not add to totals because of rounding or because farm workers are not shown separately.

Table 24. Occupational distribution of employment in 11 large cities by sex and race, 1977 annual averages

(Percent of total employed)

Area	Total employed	White-collar workers					Blue-collar workers					Service workers
		Total	Professional and technical	Managers and administrators, except farm	Sales workers	Clerical workers	Total	Craft and kindred workers	Operatives, except transport	Transport equipment operatives	Nonfarm laborers

[1] Data for these areas are based on 1970 geographic boundary definitions. Consequently, the number of unemployed may differ from data for the same area shown in earlier tables. Area boundary definitions in 1970 and 1973 are shown in appendix B.

NOTE: Items may not add to 100.0 percent because of rounding. Data for demographic groups are not shown when they do not meet BLS standards of reliability for the particular area, based on the sample in that area. See appendix A.

Section V. Unemployment Estimates for States and Large Labor Market Areas

The tables that follow include monthly estimates of the labor force and unemployment for States and the District of Columbia and annual average unemployment rates for the 214 largest Labor Market Areas (LMA's). These estimates are produced for use in the administration of the Comprehensive Employment and Training Act of 1973, as amended, the Public Works and Economic Development Act of 1965, as amended, the Buy American Act (Executive Order 10582), and Defense Manpower Policy No. 4A.

The data are the product of a Federal-State cooperative program in which State employment security agencies prepare labor force and unemployment estimates under concepts, definitions, and te hnical procedures established by the Bureau of Labor Statistics (BLS).

For 10 large States and 2 large areas, the size of the CPS sample is sufficient to obtain monthly estimates meeting BLS reliability standards (table 28). Statistics derived from State unemployment insurance (UI) operations, adjusted using factors obtained from the CPS and other sources, are used to calculate estimates for the other 40 States, the District of Columbia, and for LMA's (tables 29 and 30). The estimating method is described briefly below and in greater detail in appendix C.

In the 10 largest States (California, Florida, Illinois, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Texas) and two areas (New York City and Los Angeles-Long Beach), the monthly estimates are taken directly from the CPS. These State and area estimates meet BLS standards of reliability (10 percent coefficient of variation on the level of unemployment at a 6-percent rate of unemployment at one standard error). In the remaining 40 States and the District of Columbia, a 6-month moving average adjustment (using CPS and UI-based data for the State) is applied to the UI-based estimate to bring the State estimate into conformity with national definitions of employment and unemployment. Estimates for the Labor Market Areas (except for Los Angeles-Long Beach) are obtained from the UI-based estimates adjusted to the State total for employment and unemployment, using the methods in appendix C.

Once each year, the monthly employment and unemployment estimates for the 10 large States and two large areas are revised to be consistent with new population estimates. The UI-based estimates in the remaining States and the District of Columbia are adjusted or "benchmarked" to annual averages obtained from the CPS. Estimates for areas within the States are then adjusted so that the sub-State components add to the Statewide totals. The LMA estimates in the following tables have been benchmarked to State totals from the 1977 and 1978 CPS annual averages for each State. An explanation of the technical procedures and the benchmarking process under which these estimates are produced also appears in appendix C.

Monthly estimates for the States and LMA's shown here are published as table E-1 in *Employment and Earnings*, and as a monthly BLS news release, "State and Metropolitan Area Unemployment". Estimates for smaller LMA's, all counties, cities of 25,000 population or more, and other jurisdictions required for administrative purposes (prime sponsors, program agents, etc.) are also published monthly through the National Technical Information Service of the U.S. Department of Commerce. However, because of the small size of many of the areas, as well as the limitations of the data inputs, users are cautioned that the data in the following two publications should be used only to fulfill the program needs for which the estimates were developed: *State, County, and Selected City Employment and Unemployment*, and *CETA Area Employment and Unemployment*, both available in either printed form or microfiche from the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, Virginia 22161.

CETA Area Employment and Unemployment includes an appendix showing data mandated under the 1978 Amendent to the CETA Act of 1973 and under Defense Manpower Policy No. 4A which require that BLS publish CPS-based data for the 30 large metropolitan areas shown in sections III and IV, in addition to estimates for the same areas based on the Federal-State Cooperative Program shown in this section.

[1] Estimates for these areas are not comparable with previously published data because these 30 large metropolitan areas, formerly adjusted to the CPS metropolitan area estimate on an annual average basis, are now independently estimated using the UI-based estimating procedure.

p = provisional. Estimates are subject to revision when revised estimates of the population are obtained.

r = revised to reflect changes in the independent population estimates. These changes affect labor force and unemployment levels but do not affect the unemployment rate.

Appendix A. Reliability of Estimates and Sampling Error Tables for CPS Estimates

The estimates presented in sections I-IV of this report are based on the Current Population Survey (CPS)–a sample of the population rather than a complete count. Consequently, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as were used in the CPS. In general, the relative error of a sample estimate varies inversely with the size of the sample and the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a relatively larger error than an estimate for a subgroup constituting a large proportion of that population.

The proportion of the total population sampled in the CPS differs among the States. In general, the smaller the population, the larger the sampling proportion. For example, in Vermont approximately 1 in every 350 households is sampled, whereas in New York the sample covers about 1 in every 1,500 households. Differences in the probability of selection of households in each area are necessary to obtain statistically consistent total unemployment levels–with a maximum expected coefficient of variation of 10 percent or less, at a 6-percent unemployment rate.

Publication standards

The publication of data with comparable reliability for all areas, including States, SMSA's, and cities, therefore requires unique standards for minimum labor force, employment, and unemployment levels, based on the known differences in sampling intervals among these areas.

For subgroups in the population, the small numbers sampled could introduce another element of difference in reliability among the areas. Consequently, BLS requires that at least 30 sample cases be the basis for publication of distributions (either numerical levels or percentages) of data below the State or area totals. Table A-1 lists the minimum necessary base for publication of data in each of the States, the District of Columbia, and metropolitan areas.

Estimates are not shown in this report when they do not meet the minimum standard for the State or area listed in table A-1. In any particular table, the determining factor for publication is the size of the base of the distribution. In tables showing labor force status, the size of the labor force used to determine the unemployment rate for the particular group determines whether data for that group are published. In all other distributions, the determining factor is the total–which equals 100 percent. Data are not published for any cell with fewer than 500 persons or less than 1.0 percent in order to reduce errors caused by rounding of the data.

Using the sampling error tables

The sampling error tables (tables A-2 to A-21) can be used directly to develop 90-percent confidence intervals for sample estimates. They indicate the order of magnitude of the sampling error rather than the precise amount of error. Table A-2 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have a sampling error of 9,000, while an estimate of 100,000 unemployed persons for the same population group in Alabama has a sampling error of 13,000.

To calculate a 68-percent confidence interval (2 chances out of 3), multiply the sampling error by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 9,000. At 68-percent confidence, the error would be about 5,400 (9,000 X 0.6 = 5,400). At 95-percent confidence, the error would be about 11,000 (9,000 X 1.19 = 10,710).

To compute the error of a difference from the tables, an additional step is required. For instance, one may wish to know whether a change in unemployment rate from 1977 to 1978 in a particular area is statistically "significant" or whether differences in the unemployment rates of two areas or population groups are statistically meaningful.

To test for the significance of a difference, the following formula should be used:

$$Z = \sqrt{a^2+b^2-C}$$

where: a = the error of one group or year
b = the error of another group or year
C = the covariance (or relationship) between a and b
Z = the error of the difference

Estimates for the "C" term for areas in this report are not available. If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated An example will show how this test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from

10 percent to 8 percent between 1977 and 1978 was statistically significant. Assume that the labor force was about 100,000 in both years. Table A-8 gives the error for a 10.0-percent unemployment rate as 1.11 and for an 8.0-percent unemployment rate as 1.01. Using the formula described above, the following would result:

$$a = 1.11$$
$$b = 1.01$$
$$a^2 + b^2 = 2.25$$
$$\sqrt{2.25} = 1.50$$

Assuming a negligible "C" term, the error of the difference is 1 5. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error.

To derive a more precise sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table A-2 contains no sampling error for an estimate of 500,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 500,000 in Alabama:

$$Z = \left[\left[(S - B) \;/\; (A - B)\right] \times (X - Y)\right] + Y$$

where: A = published size immediately above the size desired (600,000)
B = published size immediately below the size desired (400,000)
S = size desired (500,000)
X = error of A (28,000)
Y = error of B (24,000)
Z = error of S (26,000).

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "A" term is the highest value in the table and the "B" term becomes the next highest value.

Appendix B. Geographic Boundary Definitions for the 30 Largest Metropolitan Areas

This appendix lists the geographic boundary definitions of the 30 largest metropolitan areas in the United States, using the two methods by which the areas are defined for statistical purposes, Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's).

The Department of Labor has used LMA's for a number of years for various administrative and program purposes. Designed to measure conditions of the labor force within reasonable commuting distance of a large central city (or cities), the geographic boundaries for almost all LMA's are the same as those for SMSA's as defined by the Office of Federal Statistical Policy and Standards. SMSA boundaries are defined using a set of uniform criteria, while LMA's are defined jointly by the State Employment Security agencies and the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

An SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are comprised of cities and towns, the minimum population size is 75,000.

The geographic boundaries of the SMSA's are occasionally revised, resulting in a break in the data series for the revised areas. The table that follows compares the boundaries of the 30 largest SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. Estimates in sections III and IV refer to SMSA's while those in section V refer to LMA's. Geographic boundaries are revised periodically, and are published annually in the May issue of *Employment and Earnings.*

Table B-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition[1]	SMSA 1973 definition[2]	LMA definition[3]
Anaheim-Santa Ana-Garden Grove ..	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Du Page, Kane, Lake, McHenry, Will	Same	Same
Cincinnati	Ohio portion: Counties of Clermont, Hamilton, Warren Kentucky portion: Counties of Boone, Campbell, Kenton Indiana portion: Dearborn County	Same	Same
Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Counties of Hood, Parker, and Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri portion: Counties of Cass, Clay, Jackson, Platte Kansas portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same
Minneapolis-St. Paul	Minnesota portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same

See footnotes at end of table.

Table B-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)—Continued

Area	SMSA 1970 definition[1]	SMSA 1973 definition[2]	LMA definition[3]
New York	New York portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County, N.Y., and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey portion: Counties of Burlington, Camden, Gloucester	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	District of Columbia Virginia portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County, Md.	1973 definition

[1] 1970 area definitions are used in sections III and IV, tables 9, 17, 19, and 27.

[2] 1973 area definitions are used in all tables in sections III and IV except as indicated in footnote 1, above.

[3] A Labor Market Area (LMA) is defined by the Department of Labor for program purposes. In most metropolitan areas, the LMA and SMSA are conterminous. All data in section V refer to LMA's unless specifically noted.

Appendix C. Procedures for Estimating Employment and Unemployment Under the Federal-State Cooperative Program

Estimating methods

Employment and unemployment estimates for the 10 large States (New York, California, Illinois, Ohio, New Jersey, Pennsylvania, Michigan, Texas, Massachusetts, and Florida) and two large areas, (New York City and the Los Angeles-Long Beach LMA) are taken directly from the Current Population Survey (CPS). For a description of CPS concepts, see the BLS periodical *Employment and Earnings*, Explanatory Note A, "Household Data."

Estimates for the remaining 40 States and the District of Columbia are prepared by State employment security agencies under standardized procedures developed by the Bureau of Labor Statistics The estimates are prepared in several stages, as explained below.

Labor force and unemployment estimates for States, labor market areas (LMA's), and other areas covered under Federal assistance programs are developed by State employment security agencies under a Federal-State cooperative program. The local unemployment estimates which are derived from standardized procedures developed by BLS are the basis for determining eligibility of an area for benefits under Federal programs such as the Comprehensive Employment and Training Act, and the Public Works and Economic Development Act.

Preliminary estimate—employment

The total employment estimate is based primarily on data from the survey of establishments which produces an estimate of payroll employment. This place-of-work estimate must be adjusted to refer to place of residence as used in the CPS. Factors for adjusting from place of work to place of residence have been developed for the major categories of employment by class of worker and industry on the basis of employment relationships which existed at the time of the 1970 decennial census. These factors are applied to the payroll employment estimates for the current period to obtain adjusted employment estimates.

Estimates of employment for workers not covered by the payroll survey, such as agricultural workers and self-employed and unpaid family workers are also developed using special surveys, national historical relationships, and census data.

Preliminary estimate—unemployment

In the current month, the estimate of unemployment is an aggregate of the estimates for each of three categories: (1) Persons who were previously employed in industries covered by State UI laws; (2) those previously employed in industries not covered by these laws; and (3) those who were either entering the labor force for the first time or reentering after a period of separation. This is referred to below as the UI-based estimate.

An estimate for those previously employed in covered industries is derived from a count of current unemployment insurance claimants, plus estimates of claimants whose benefits have been exhausted, those persons disqualified from receiving benefits for nonmonetary reasons (because they quit, were discharged for cause, etc., but would otherwise have been eligible), and persons who either filed claims late or not at all.

The estimate of those previously employed in industries not covered by UI is derived by applying to the employment estimate for each noncovered industry or class of worker subgroup in the State the ratio of covered unemployment to covered employment, weighted by factors reflecting national historical relationships.

For the third category, new entrants and reentrants into the labor force, a composite estimate is developed from equations that relate the total entrants into the labor force to the experienced unemployed and the experienced labor force. For each month, the estimate of entrants into the labor force is a function of: (a) the month of the year; (b) the level of the experienced unemployed; (c) the level of the experienced labor force; and (d) the proportion of the working-age population that is considered "youth." The composite estimate of total entrants is defined as:

$U = A(X+E) + BX$, where
U=total entrant unemployment
E=total employment
X=total experienced unemployment
A,B=synthetic factors incorporating seasonal variations and an assumed relationship between the proportion of youths in the working population and the historical relationship of entrants to the experienced unemployed (B factor) or the experienced labor force (A factor)

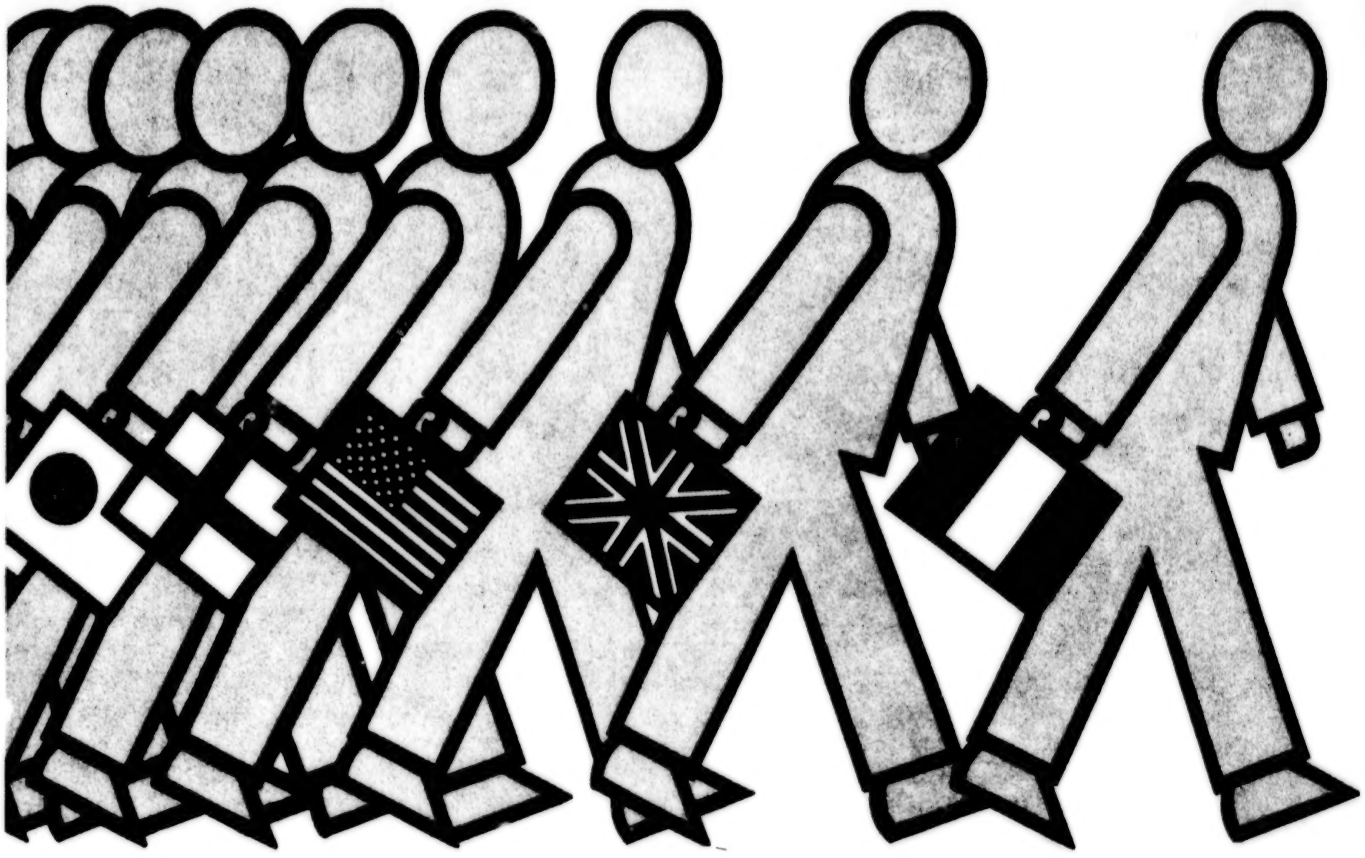
Correction factors

Correction factors are then applied at the State level to the UI-based estimates obtained above for each of the 40 States and the District of Columbia. These correction factors are based on the ratio of the CPS to the UI-based estimates for the 6-month period ending in the current month (e.g. a 6-month moving average).

Sub-State adjustment for additivity

Independent estimates of employment and unemployment are prepared both for the State (obtained directly from the CPS in the 10 large States or by the UI-based method in the remaining States), and labor market areas (LMA's) within the State. The total labor force included in the LMA's exhaust the geographic boundaries of the State. A proportional adjustment is applied to all sub-State LMA estimates to ensure that the sub-State estimates of employment and unemployment add to the independent State totals. In California and New York, which also have sub-State areas taken directly from the CPS, the additivity adjustment for the remaining areas is applied to the State total minus the direct CPS area.

Benchmark correction procedures



Once each year monthly estimates prepared by State employment security agencies using UI-based estimating procedures are adjusted, or benchmarked, by BLS to the annual average CPS estimates for the 40 States for which monthly CPS estimates are not available. This adjustment is necessary because the State-prepared estimates are not as reliable as the CPS annual averages due to differences in State UI laws, the structural limitations of the UI-based estimating method, and errors in the UI data.

The benchmarked estimates are produced in three stages. First, the monthly UI-based estimates are adjusted by the ratio of the CPS to the UI-based annual averages. Second, the difference between the ratio of annual averages for two consecutive years is wedged into the monthly estimates in order to minimize the disturbance to the original series. Finally, the second-stage estimates are forced into agreement with CPS annual averages. In the 10 States which use CPS estimates monthly, no benchmark correction is required, as the average of the 12 monthly State CPS estimates will equal the CPS annual averages.

The CPS estimates in the 10 large States and two large areas are adjusted each year to incorporate revised independent population estimates provided by the Bureau of the Census. These revised population estimates affect the levels of employment and unemployment, but do *not* affect the unemployment rate.

The estimates for LMA's in section V have been adjusted to conform to CPS annual average estimates for the States.

International Comparisons of Unemployment

Americans can make valid comparisons of U.S. unemployment rates with those of other industrial countries by using this 168-page bulletin. The study adjusts foreign unemployment rates to U.S. concepts for the period from 1959 through late 1977. It also includes data on labor force, employment, participation rates, employment-population ratios, and unemployment by age and sex for the United States, Canada, Australia, Japan, France, Germany, Great Britain, Italy, and Sweden. A concluding chapter investigates many of the reasons why international unemployment rates differ so widely even after adjustment for definitional differences. The bulletin includes 15 charts.

Preface

This report is the latest in a series presenting labor force data from the Current Population Survey (CPS) for States, large metropolitan areas, and central cities. It provides 1979 annual average demographic and economic characteristics of the labor force in the States and similar data for 30 large Standard Metropolitan Statistical Areas and 11 large cities. Data for earlier years are published in the following reports: *Geographic Profile of Employment and Unemployment, 1971* (Report 402); *1972* (Report 421); *1973* (Report 431); *1974* (Report 452); *1975* (Report 481); *1976* (Report 504); *State Profile of Employment and Unemployment, 1977* (Report 539); and *Geographic Profile of Employment and Unemployment: States, 1978, Metropolitan Areas, 1977-78* (Report 571).

The official BLS estimates presented in section IV are developed from a Federal-State cooperative program and are used in the administration of Federal fund allocation programs. However, the data from the CPS for metropolitan areas and cities shown in section III are also used in the administration of section 202 (F) (2) (B) of the Comprehensive Employment and Training Act Amendments of 1978.

Unless specifically identified as copyright, material in this publication is in the public domain and may, with appropriate credit, be reproduced without permission.

This report was prepared in the Office of Employment Structure and Trends, Division of Local Area Unemployment Statistics, Martin Ziegler, Chief, by Anderia Thomas, Russ Marshall, and Richard Rosen, with the assistance of Joyce Willingham. Technical assistance was provided by Denis Keyes and Sandy Grove, under the supervision of Fred Cronkhite. Overall direction was provided by Sylvia Small.

Geographic Profile of Employment and Unemployment, 1979

Data about unemployment in States and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program.

The CPS is the regular monthly survey of about 56,000 households from which the national unemployment rate is derived.(See appendix A for CPS definitions.) Annual average estimates of the demographic characteristics of the labor force (age, sex, and race) and the economic characteristics of the employed and unemployed are published for the 50 States, 30 large Standard Metropolitan Statistical Areas (SMSA's), and 11 large cities, if they meet BLS standards of reliability for publication. Estimates for the States are shown in section II and for the SMSA's and cities in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error. Error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections II and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections.

The Federal-State Cooperative Program provides monthly and annual average labor force and unemployment estimates for the 50 States and for 214 major labor market areas (section IV.) These estimates are largely based upon administrative statistics from the unemployment insurance system, adjusted to conform to CPS annual estimates for the States. For the 10 largest States, both the monthly and annual estimates are obtained from the CPS. Appendix D describes the procedures for estimating employment and unemployment under this program.

Section I. Review of Demographic Changes, 1979

Labor force changes in the States

In 1979, the national civilian labor force totaled almost 103 million workers. Over half resided in the 10 most populous States and about one-fourth lived in just three of these large States—California, New York, and Texas. (See text table 1.)

The national civilian labor force grew by 2.5 percent from 1978 to 1979. This was a slower rate of growth than the 2.9-percent rate from 1977 to 1978, but was about the same as the average growth rate for the preceding 10 years.

There was wide variation in civilian labor force growth among the States. The labor force increased significantly[1] in 19 States from 1978 to 1979. The growth rates in these States ranged from 2.1 percent in New York to over 7 percent in a number of Western States. (See text table 2.) There were no States where the labor force dropped significantly.

Labor force growth by demographic group. The national civilian labor force of white workers grew by 2.4 percent from 1978 to 1979. However, gains were significant in only 19 States, where gains for whites ranged from about 3 percent in Wisconsin to almost 20 percent in Hawaii. (See text table 3.) There were no States with significant decreases in the white labor force.

The national civilian labor force of black and other workers (a group which includes not only black persons, but Asians and Pacific Islanders, Alaskan Natives, American Indians, and all races other than white) grew by almost 3 percent from 1978 to 1979. Significant labor force gains for this group occurred in five States—New York, Pennsylvania, Nevada, Massachusetts, and Colorado. In the latter three States, the increases were considerably above the national average. By contrast, there were significant labor force decreases for black and other workers in three States—Hawaii, Alaska, and Oklahoma—and also in the District of Columbia.

The national civilian labor force of adult men (20 years and over) grew by just under 2 percent from 1978 to 1979. Four States had significant gains for adult men—Texas (4.1 percent), Idaho (7.4 percent), Washington (8.6 percent), and Wyoming (8.7 percent). In no States were there significant declines in the adult male labor force.

[1] The word "significant" in this report means that a statistical test of significance (the Z transformation) has been performed on the data and that the year-to-year change in a sample estimate or the difference between two sample estimates has been found to be "statistically significant." This method takes into account the statistical error (sampling variability) of estimates, based on the sample in each State. See appendix B for further discussion.

Text table 1. Civilian labor force in the 10 largest States, ranked by size, 1979 annual averages

[Numbers in thousands]

State	Civilian labor force	Percent of national total
United States	102,908	100.0
California	10,968	10.7
New York	8,008	7.8
Texas	6,244	6.1
Illinois	5,331	5.2
Pennsylvania	5,296	5.1
Ohio	5,036	4.9
Michigan	4,313	4.2
Florida	3,835	3.7
New Jersey	3,537	3.4
Massachusetts	2,891	2.8

Text table 2. States with significant labor force growth from 1978 to 1979, ranked by rate of growth

State	Growth in labor force (percent)
United States	2.5
Utah	8.1
Washington	7.9
Wyoming	7.7
Colorado	7.3
Nevada	7.2
Arizona	5.9
Connecticut	4.6
Idaho	4.2
Texas	4.2
New Hampshire	4.0
Florida	4.0
Louisiana	3.7
Minnesota	3.5

Connecticut	4.3
Alaska	4.1
New Hampshire	4.0
Idaho	4.0
Kansas	3.9
California	3.4
Minnesota	3.3
Wisconsin	3.0

The national civilian labor force of adult women (20 years and over) grew at a rate twice as high (4.0 percent) as that of adult men. Significant gains for adult women occurred in nine States in 1979:

	Percentage point change
Utah	11.7
Wyoming	11.3
North Dakota	10.4
Arkansas	9.3
New Jersey	7.2
California	5.9
Michigan	5.7
Texas	5.0
New York	4.6

There were no States where the adult female labor force dropped significantly.

The national teenage labor force dropped slightly from 1978 to 1979. Because this group makes up a relatively small proportion of the total population, the changes in most States were not statistically significant (although many were estimated to be quite large and varied over a wide range from the national average). There was significant labor force growth for this group (over 20 percent) in Connecticut and a significant drop (almost 20 percent) in Montana.

Labor force participation by demographic group. The Labor force participation rate—the percent of the civilian noninstitutional population 16 years and over employed or looking for a job–varied from about 55 percent in West Virginia and Florida to 70 percent and over in Alaska, Nevada, and Wyoming. (See text table 4.) It is interesting to note that of the three States with the highest participation rates, one (Alaska) had the highest unemployment rate and one (Wyoming) had the lowest unemployment rate.

Participation rates of black and other workers varied over a wider range than those of white workers. About 5 out of every 10 black and other workers were in the labor force in Oklahoma and Arkansas, compared to about 8 out of 10 in Nevada and Colorado.

Participation rates of adult men continued to be the highest of all the major demographic groups. The highest rates for this group were in three Western States—Wyoming, Colorado, and Nevada (all in the 84 to 87 percent range)—and the lowest rates were in three Southern States—Florida, West Virginia, and Arkansas (all in the 70 to 73 percent range). By contrast, the rate

Text table 4. Civilian labor force participation rates for major demographic groups by State, 1979 annual averages

[Percent of population in labor force]

State	Total	White	Black and other	Adult men	Adult women	Teenagers

Wyoming	70.0	70.4	(1)	86.8	54.9	62.5

[1]Estimate not sufficiently large to meet BLS standards of reliability for the State, based on the sample in the State.

at which adult women participated in the labor force was as low as 38 percent in West Virginia.

Teenagers were more likely than adult women to be in the labor force in many States. Teenage participation rates were at least 10 percentage points above those for adult women in about half of the States. The lowest participation of teenagers was about 46 percent in Alabama and Louisiana and the highest was about 70 percent in Utah, Wisconsin, and Minnesota.

Part-time labor force. There were about 15 million persons in the national part-time labor force in 1979, almost 15 percent of the total. Most States were close to the national average in the proportion of part-time workers. In Wisconsin and Minnesota, however, part-time workers constituted almost 20 percent of the total. The part-time labor force was the smallest percentage of the total in Alaska, Georgia, and West Virginia (all about 11 percent).

Text table 5. Employment-population ratios by State, 1978 and 1979 annual averages

[Percent of population employed]

State	1978	1979
Alabama	55.5	55.3

Wisconsin	63.8	68.2
Wyoming	67.0	67.8

Employment changes in the States

Total employment grew significantly in 17 States from 1978 to 1979. Employment growth was particularly pronounced (over 6 percent) in a number of Western States—Nevada, Arizona, Utah, Washington, Wyoming, and Colorado. Growth in all of these States greatly exceeded the national average increase of 2.7 percent over the same period.

About two-thirds of the working-age population in Colorado, Kansas, Minnesota, Nevada, New Hampshire, South Dakota, Wisconsin, and Wyoming had jobs in 1979. (See employment-population ratios in text table 5.) As in the previous year, however, only about one-half of the working-age population was employed in Florida (where many retired persons live) and in West Virginia (where adult women have the lowest labor force participation rate in the Nation).

Employment growth by demographic group. Employment of black and other workers grew significantly in five States from 1978 to 1979—New York, Pennsylvania, Nevada, Massachusetts, and Colorado. In all of these States, the growth rate was at least double the national growth rate of 3.6 percent for this group. There were significant decreases in employment of black and other workers in two States—Alaska and Arkansas—and in the District of Columbia.

Employment of adult men grew by 2.1 percent nationally from 1978 to 1979. However, gains were significant in only six States—California (2.5 percent), Texas (4.3), Colorado (6.6), Idaho (7.7), Washington (8.3), and Wyoming (8.8).

Employment gains of adult women tended to be relatively larger and more widespread than those of adult men. As employment of adult women grew nationwide by 4.3 percent from 1978 to 1979, significant increases occurred in seven States:

	Percentage point change
North Dakota	12.1
Wyoming	11.8
Utah	10.9
New Jersey	8.2
California	6.7
Texas	6.0
New York	4.8

Nationally, teenage employment was virtually unchanged from 1978 to 1979. Although there were a number of States with large apparent changes (both in-

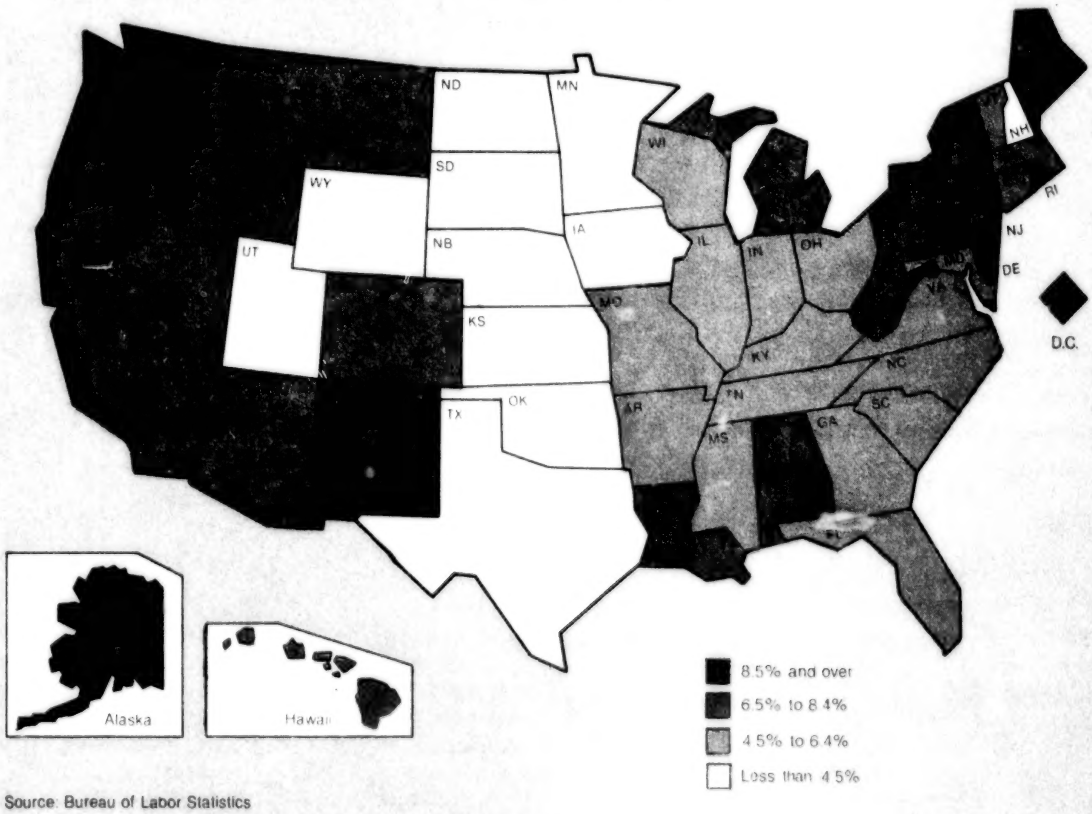
creases and decreases), only Connecticut showed a significant change—an increase of about 25 percent.

Unemployment rates in the States

The national unemployment rate inched downward from a 6.0-percent annual average in 1978 to 5.8 percent in 1979. There were eight States where rates dropped significantly:

	Percentage point change
Alaska	-2.0
Hawaii	-1.4
Mississippi	-1.3
California	- .9
North Dakota	- .9
Illinois	- .6
New York	- .6
Texas	- .6

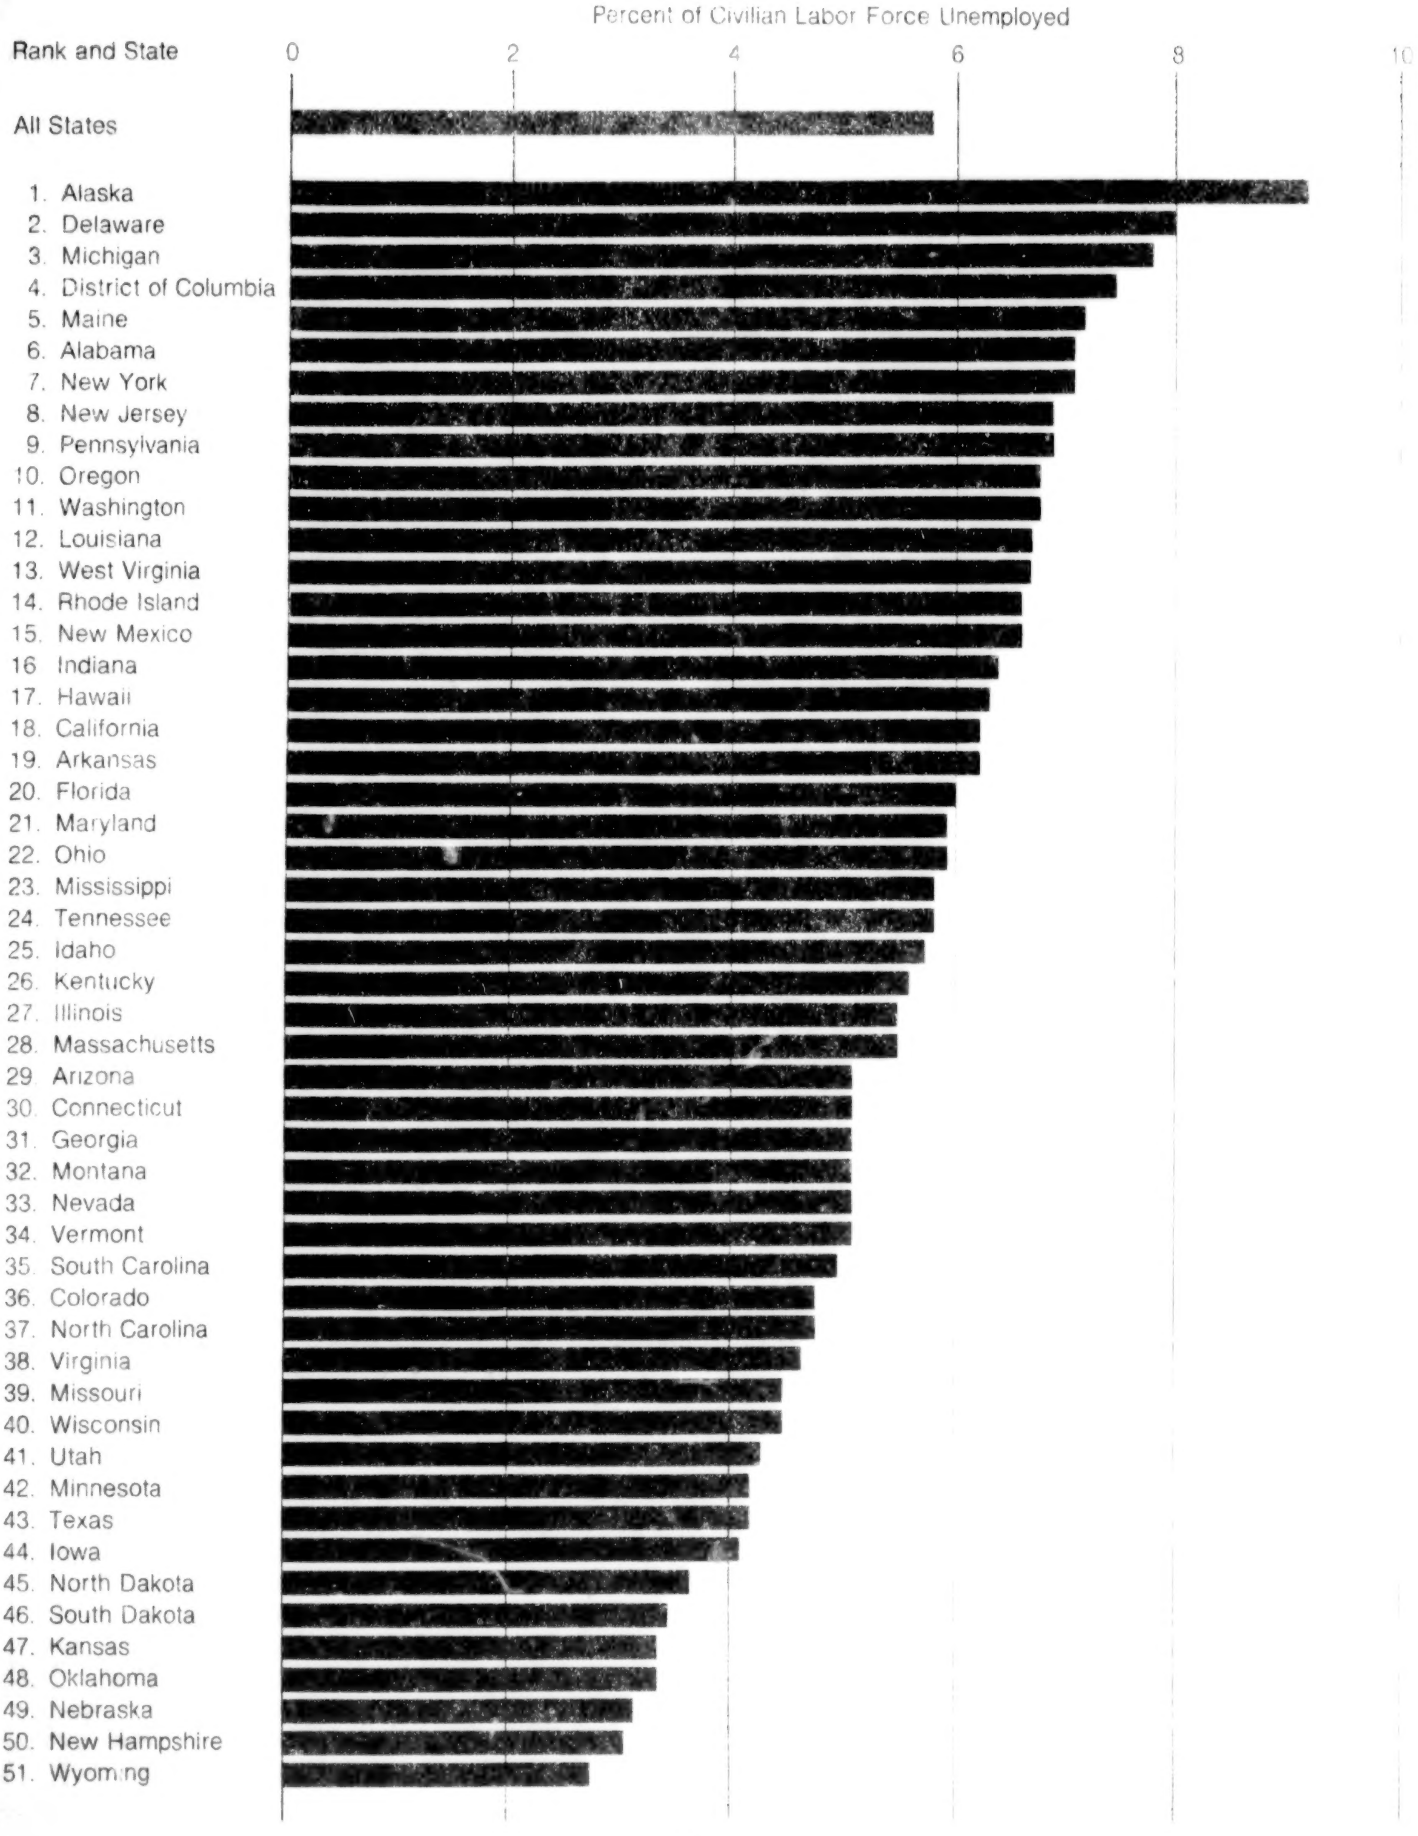
Alaska was the only State with a decrease as large as 2 percentage points between 1978 and 1979. By contrast, there had been nine States where unemployment fell this much over the 1977-78 period and four such States over the 1976-77 period. The unemployment rate rose significantly in only one State in 1979, Michigan (up 0.9 percentage points).



Although the improvement in Alaska was the sharpest in the Nation, this State continued to have the highest unemployment rate in 1979 (9.2 percent). Unemployment has been especially severe in Alaska during the 3 years since the completion of the oil pipeline.

The highest 1979 unemployment rates within the contiguous United States were in Delaware (8.0 percent) and Michigan (7.8 percent). However, there were 14 States where rates were 6.5 percent or higher. In many of these States, including all three of the large mid-Atlantic industrial States (New York, New Jersey, and Pennsylvania), unemployment of over 6.5 percent has persisted since 1975.

States with low unemployment in 1979, as in earlier years, tended to be clustered in the north central farm belt. However, the State with the lowest unemployment rate (2.8 percent) was Wyoming (charts 1 and 2).



Unemployment rates by demographic group. Unemployment rates of white workers ranged from a low of 2.8 percent in Wyoming to 8.7 percent in Hawaii, compared to a national average of 5.1 percent for this group in 1979.

Chart 1. Unemployment rates by State, 1979 annual averages

Source: Bureau of Labor Statistics

Chart 2. States ranked by unemployment rate, 1979 annual averages

There were significant decreases for white workers in eight States from 1978 to 1979:

	Percentage point change
Alaska	-1.3
Arkansas	-1.3
Montana	-1.1
North Dakota	-1.0
Virginia	- .9
New York	- .8
California	- .7
Texas	- .5

Rates for white workers rose significantly in only one State—Indiana (up 0.8 percentage points).

Black and other workers continued to have higher unemployment rates than white workers in most States. The range of rates for black and other workers was both higher and wider than for whites—extending from 5.3 percent in Hawaii to 17.3 percent in Arkansas. The national unemployment rate for this group was 11.3 percent in 1979.

Unemployment rates for black and other workers dropped significantly from 1978 to 1979 in five States—Alaska (-4.1), California (-2.2), Hawaii (-1.9), Illinois (-3.4), and Mississippi (-3.5). Rates rose significantly in two States, Arkansas and New Mexico, both of which had increases of 5 percentage points. Over the same period, the national rate for this group dropped 0.6 of a percentage point from a rate of 11.9 percent in the previous year.

Unemployment rates of the Hispanic-origin population were higher than those of white workers, but below the rate of black and other workers in the Nation and in all of the five States (and the three-State combined area) for which data on these workers are available. The highest rate for Hispanic workers in this group of States was 10.5 percent in New York, and the lowest was 5.7 percent in Florida—compared with a national average of 8.3 percent for this group in 1979.

Adult men had a national average unemployment rate of 4.1 percent in 1979. The highest rate for adult men was in Alaska—8.5 percent. Although a marked improvement from the 11.6 percent of the year before, this high rate appears to be a continuing aftereffect of the completion of the oil pipeline. Alaska was the only State where the rate for adult men was significantly higher than the rate for adult women in 1979.

The highest unemployment rate for adult men in the contiguous United States was in Michigan (6.2 percent), where automobile industry layoffs affected employment in the latter part of 1979. Rates for adult men were lowest (about 2 percent) in Nebraska, New Hampshire, and Oklahoma.

Changes in the unemployment rates of adult men were statistically significant in only seven States in 1979. In three States—Alaska, California, and New York—their rates fell sharply. By contrast, their unemployment rates rose markedly after several years of decline in Indiana and Michigan (where there were layoffs in the automobile and related industries) and Nevada (where the tourist industry was affected by summer gasoline shortages). The rate also rose significantly in Kansas.

Adult women, whose national unemployment rate was 5.7 percent in 1979, fared especially well in Nebraska and North Dakota, where their rates were below 3 percent. Unemployment rates for adult women were highest in Delaware (9.1 percent), followed by Alabama (7.8 percent) and Michigan (7.7 percent). In about 3 out of 5 States, women's 1979 rates were significantly higher than those of men.

Unemployment rates of adult women changed very little in 1979 in most States. Decreases were significant in only seven States—Alaska, California, Hawaii, Illinois, Mississippi, North Dakota, and Texas. The only State in which the unemployment rate of adult women increased significantly was Wyoming.

Teenagers experienced a national unemployment rate of 16.1 percent in 1979. Although their rates were significantly higher than those for adults in almost every State, they followed nearly the same geographic pattern as adults. Teenage rates were lowest (less than 10 percent) in New Hampshire and Vermont, as well as in a number of States near the geographic center of the Nation—Montana, the Dakotas, Nebraska, Kansas, and Oklahoma. Teenage rates were highest (23 to 25 percent) in Hawaii, Alabama, and West Virginia.

Because the number of teenagers in the labor force of every State is relatively small—ranging from about 8 to 12 percent—the sampling variability of teenage unemployment rates can be very high. (See error ranges of 1979 rates in table 1 and appendix B.) Thus, apparent changes in teenage unemployment rates in 1979 were statistically significant in only four States: Montana, New Hampshire, Oklahoma, and South Carolina. In all four States, the teenage unemployment rate decreased in 1979.

Unemployment of part-time workers. The national unemployment rate for the part-time labor force was 8.7 percent in 1979. In 12 States, the rate for this group was estimated at 10 percent or above. The highest unemployment rates for part-time workers were 14.4 percent in Delaware and 12.5 percent in Rhode Island.

Although the national part-time unemployment rate was about one and one-half times the national full-time rate (5.3 percent), in a number of States the part-time rate was more than double the full-time rate. This was the case in Connecticut, Delaware, Maryland, Massachusetts, North Carolina, Rhode Island, Virginia, Wisconsin, and Wyoming. In Wisconsin, for example, the full-time rate was only 3.5 percent, but the part-time

rate was 8.5 percent (about two and one-half times as large).

Duration of unemployment. Almost half of the unemployed in the United States had been looking for work for less than 5 weeks and about 80 percent for less than 15 weeks in 1979. Short-term unemployment (less than 15 weeks) affected a larger-than-average share of the unemployed in many of the north central farm States and in the mountain States—notably Colorado (91 percent) and Utah (about 90 percent).

The long-term unemployed (15 weeks or longer), about 20 percent of the unemployed nationally in 1979, constituted about 30 percent of the unemployed in New York State—the State with the largest percent of long-term unemployment. Most of the other States where long-term unemployment exceeded the national average were industrial States in the eastern half of the Nation. (See chart 3.) In the western United States, Alaska was the only State where the percentage of long-term unemployed (28.1 percent) was comparably high.

Delaware and Hawaii had the largest proportion of persons who had been continuously unemployed for a year or more in 1979—over 8 percent. Nationally, 4.2 percent of the unemployed had been looking for a job for a year or more.

Reason for unemployment. Four out of every 10 unemployed persons in the United States in 1979 had lost their previous jobs. However, job losers (persons looking for work whose previous employment ended involuntarily, including those on temporary and indefinite layoff) were more than half of the unemployed in Rhode Island, where layoffs occurred in nondurable goods manufacturing. Job losers also constituted over half of the unemployed in Idaho, where there were employment declines in the lumber and wood products and transportation equipment industries. Loss of a job (especially by layoff) was also a relatively important factor in Michigan, where there was a slowdown in transportation equipment manufacturing and related industries. In three other Eastern States (New Jersey, New York, and Pennsylvania), the proportions of persons who lost jobs were also above the national average in 1979 (as they have been in recent years).

Job leavers (persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work) were 14.3 percent of the unemployed nationwide in 1979. Job leaving accounted for a relatively high percentage of unemployment in Kansas (25.6 percent), Utah (24.0 percent), and Texas (21.3 percent)—all States with low overall unemployment rates.

Chart 3. Percent unemployed 15 weeks or more, by State, 1979 annual averages

Source: Bureau of Labor Statistics

Reentrants (persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before their current job search) made up 29.5 percent of all unemployed persons in the Nation during 1979. Half of these reentrants were adult women, and the balance was split evenly between adult men and teenagers. Reentry unemployment was significant in Colorado, where about 40 percent of the unemployed were reentrants. Reentry was also a large factor in Arkansas, North Dakota, Utah, and Virginia (all about 36 percent).

New entrants (persons who never worked at a full-time job lasting 2 weeks or more) made up 13.4 percent of the Nation's unemployed in 1979. A large majority of these new entrants were teenagers. Initial entry unemployment was especially marked in Delaware, where both total and teenage unemployment rates in 1979 were among the highest in the country.

Unemployment in 30 large metropolitan areas by race and Hispanic origin

Unemployment estimates in 30 of the largest metropolitan areas of the Nation are available separately by race and Hispanic origin. These estimates indicate that, although the national unemployment rate of black and other workers was double that of white workers in 1979, the size of the gap varied widely among the large metropolitan areas—from just above the rate for white workers in the San Jose and San Diego Standard Metropolitan Statistical Areas (SMSA's) to considerably more than twice the rate for white workers in the Baltimore, Kansas City, and St. Louis SMSA's. (See text table 6). Black and other workers are defined as including—in addition to black workers—American Indians, Alaskan Natives, Asians and Pacific Islanders, and all races other than white. Except in Alaska and Hawaii, blacks are the major minority group in most areas. However, in San Jose and San Diego, the black and other category includes a larger percentage of other minorities (primarily Chinese, Japanese, and Filipino) than in the Baltimore, Kansas City, and St. Louis SMSA's.

In six SMSA's, unemployment rates of black and other workers were significantly below the national average unemployment rate of 11.3 percent for this group

Error ranges are shown for 1979 unemployment rates at the 90-percent confidence interval, which means that, if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2]Unemployment rates are not shown when they do not meet BLS standards of reliability for the area, based on the sample in that area.

in 1979: Boston, Dallas-Ft. Worth, Houston, Los Angeles-Long Beach, San Jose, and Washington, D.C. The lowest rate for black and other workers—in San Jose—was 5.7 percent in 1979, while the highest rates for this group were in the Baltimore, Detroit, and Philadelphia SMSA's, where unemployment was over 16 percent in 1979. High rates persisted in most of these areas despite the fact that unemployment rates had been inching downward nationally for blacks since their peak during the 1975 recession, and none of the increases in black unemployment in large metropolitan areas were significant between 1978 and 1979. In four areas, black unemployment rates dropped significantly over the year—Chicago, Houston, and Philadelphia, and in the Los Angeles-Long Beach SMSA (where the unemployment rate of white workers also dropped significantly between 1978 and 1979.) In addition, white unemployment rates declined significantly in the Anaheim-Santa Ana-Garden Grove, Boston, New York, and San Francisco-Oakland SMSA's during that period. The only area with a significant increase in 1979 for whites was Detroit, which was beginning to feel the effects of the slowdown in automobile sales.

In 1979, the national average unemployment rate for white workers was 5.1 percent, but 11 of the 30 metropolitan areas had lower white unemployment rates. The lowest rates—about 3 percent—were in the Dallas-Ft. Worth and Minneapolis-St. Paul areas, while the highest—over 6.5 percent—were in the Buffalo and New York areas.

Among the six areas for which estimates are available for Hispanic workers, the unemployment rate ranged from as low as 3.8 percent in the Houston area to 11.2 percent in the New York area in 1979 (text table 7).

Text table 7. Unemployment rates[1] of the Hispanic-origin population, six Standard Metropolitan Statistical Areas, 1976-79 annual averages

[Percent of civilian labor force]

Area	1976	1977	1978	1979
United States	11.6	10.1	9.1	8.3
Chicago	7.9	6.9	8.2	8.0
Houston[2]	4.0	5.3	3.2	3.8
Los Angeles-Long Beach	11.0	9.2	8.3	6.9
Miami	10.0	9.6	6.2	5.2
New York[2]	13.3	11.8	11.3	11.2
San Francisco-Oakland	13.0	8.5	10.3	5.1

[1]Error ranges for the Hispanic-origin population were not available at the time of publication.

[2]These data for the Hispanic-origin population are based on the 1970 boundary definition for the SMSA. Therefore, they are not strictly comparable with data for the SMSA appearing in other tables in this report.

Section II. State Estimates from the Current Population Survey, 1979 Annual Averages

Table 1. Labor force status of the civilian noninstitutional population 16 years and over by State, sex, age, and race, 1979 annual averages

[1] Error ranges are shown at the 90-percent confidence interval, which means that, if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases, the true value based on a complete census of the population would be contained within these error ranges.

[2] According to the 1970 census, black workers constituted about 89 percent of the "black and other" population group for the Nation. However, the proportion of black workers in the black and other population varies within each State. For instance, in the State of North Carolina, the black and other category is comprised mostly of black workers; in the State of Hawaii, the black and other category is composed largely of Asians and Pacific Islanders.

NOTE: Items may not add to totals because of rounding. Data for demographic groups are not shown when they do not meet BLS standards of reliability for the particular State based on the sample in that State. See appendix B.

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS standards of reliability for the particular State, based on the sample in the State. See appendix B.

NOTE: Numbers may not add to totals because of rounding.

[1] Data are not shown when they do not meet BLS standards of reliability for the particular State, based on the sample in that State. See appendix B.

[2] Estimates are not shown where there are less than 500 persons employed or unemployed.

[3] Less than 1.0 percent.

NOTE: Items may not add to totals because of rounding. Unemployed persons with no previous work experience are not shown separately but are included in total. Unemployment rates shown were calculated using unrounded data.

[1] Less than 500 persons employed or less than 1.0 percent of total employed.

[2] Data for 3 States were combined to obtain more reliable estimates.

NOTE: Items may not add to totals because of rounding. Data are not shown separately for black and other races when the employment estimates for black and other races is not sufficiently large to meet BLS standards of reliability for the particular State, based on the sample size in that State. See appendix B.

Table 6. Unemployed persons by State, duration of unemployment, sex, and race, 1979 annual averages

State	Total unemployed (in thousands)	Percent distribution by duration of unemployment

[1] All areas in this table conform to 1973 geographic boundary definitions. See appendix C.

[2] Error ranges are shown at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases, the true value based on a complete census of the population would be contained within these error ranges.

[3] According to the 1970 Census of Population, black workers constituted about 89 percent of the "black and other" population group for the Nation. However, the proportion of black workers in the black and other population varies among areas.

NOTE: Items may not add to totals because of rounding. Data for demographic groups are not shown when they do not meet the BLS standard of reliability for the particular area, based on the sample size in that area. See appendix B.

[1] Data are not shown when they do not meet BLS standards of reliability for the particular area, based on the sample in that area. See appendix B.

[2] Estimates are not shown where there are less than 500 persons employed or unemployed.

[3] Less than 1.0 percent.

NOTE: Items may not add to totals because of rounding or because farm workers are not shown separately. Unemployed persons with no previous work experience are not shown separately but are included in totals. Unemployment rates were calculated using unrounded data.

[1] Less than 1.0 percent.

[2] Data are not shown separately for black and other races where the employment estimate for black and other races is not sufficiently large to meet BLS standards of reliability for the particular area based on the sample size in that area. See apendix B.

[3] These data for the Hispanic-origin population are based on the 1970 geographic boundary definitions for the Houston and New York SMSA's.

NOTE: Items may not add to totals because of rounding.

Table 14. Occupational distribution of employment in 11 large cities by sex and race, 1979 annual averages

(Percent of total employed)

City	Total employed	White-collar workers					Blue-collar workers					
		Total	Professional and technical	Managers and administrators, except farm	Sales workers	Clerical workers	Total	Craft and kindred workers	Operatives, except transport	Transport equipment operatives	Nonfarm laborers	Service workers

[1] Data for these areas are based on 1970 geographic boundary definitions. Consequently, the number of unemployed may differ from data for the area shown in earlier tables. Area boundary definitions in 1970 and 1973 are shown in appendix C.

NOTE: Items may not add to 100.0 percent because of rounding. Data for demographic groups are not shown when they do not meet BLS standards of reliability for the particular area, based on the sample in that area. See appendix B.

Section IV. Unemployment Estimates for States and Large Labor Market Areas

The tables that follow include monthly estimates of the labor force and unemployment for States and the District of Columbia and annual average unemployment rates for the 214 largest Labor Market Areas (LMA's). These estimates are produced for use in the administration of the Comprehensive Employment and Training Act of 1973, as amended, the Public Works and Economic Development Act of 1965, as amended, the Buy American Act (Executive Order 10582), and Defense Manpower Policy No. 4A.

The data are the product of a Federal-State cooperative program in which State employment security agencies prepare labor force and unemployment estimates under concepts, definitions, and technical procedures established by the Bureau of Labor Statistics.

For 10 large States and 2 large areas, the size of the CPS sample is sufficient to obtain monthly estimates meeting BLS reliability standards (table 18). Statistics derived from State unemployment insurance (UI) operations, adjusted using factors obtained from the CPS and other sources, are used to calculate estimates for the other 40 States, the District of Columbia, and for LMA's (tables 19 and 20). The estimating method is described briefly below and in greater detail in appendix D.

In the 10 largest States (California, Florida, Illinois, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Texas) and two areas (New York City and the Los Angeles-Long Beach SMSA), the monthly estimates are taken directly from the CPS. These State and area estimates meet BLS standards of reliability (10-percent coefficient of variation on the level of unemployment at a 6-percent rate of unemployment at one standard error). In the remaining 40 States and the District of Columbia, a 6-month moving average adjustment (using CPS and UI-based data for the State) is applied to the UI-based estimates to bring the State estimate into conformity with national definitions of employment and unemployment. Estimates for the Labor Market Areas (except for Los Angeles-Long Beach) are obtained from the UI-based estimates adjusted to the State total for employment and unemployment, using the methods in appendix D.

Once each year, the monthly employment and unemployment estimates for the 10 large States and two large areas are revised to be consistent with new population estimates. The UI-based estimates in the remaining States and the District of Columbia are adjusted or "benchmarked" to annual averages obtained from the CPS. Estimates for areas within the States are then adjusted so that the sub-State components add to the statewide totals. The LMA estimates in the following tables have been benchmarked to State totals from the 1978 and 1979 CPS annual averages for each State. An explanation of the technical procedures and the benchmarking process under which these estimates are produced also appears in appendix D.

Monthly estimates for the States and LMA's shown here are published as table E-1 in *Employment and Earnings*, and as a monthly BLS news release, *State and Metropolitan Area Unemployment*. Estimates for smaller LMA's, all counties, cities of 25,000 population or more, and other jurisdictions for administrative purposes (prime sponsors, program agents, etc.) are also published monthly through the National Technical Information Service of the U.S. Department of Commerce. However, because of the small size of many of the areas, as well as the limitations of the data inputs, users are cautioned that the data in the following two publications should be used only to fulfill the program needs for which the estimates were developed: *State, County, and Selected City Employment and Unemployment,* and *CETA Area Employment and Unemployment,* both available in either printed form or microfiche from the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, Virginia 22161.

CETA Area Employment and Unemployment includes an appendix showing data mandated under the 1978 Amendments to the CETA Act of 1973 and under Defense Manpower Policy No. 4A which require that BLS publish CPS-based data for the 30 large metropolitan areas shown in section III , in addition to estimates for the same areas based on the Federal-State Cooperative Program shown in this section.

[1] Estimates for these areas are based on the Federal-State Cooperative Program and consequently differ from those shown in tables 8-13 which are based on the Current Population Survey.

p = provisional. Statewide estimates are subject to revision based on revised estimates of the population. Area estimates may be revised to reflect changes in State population controls and other benchmark adjustments.

r = revised. Statewide estimates incorporate revised estimates of the population. Area estimates incorporate revised State population controls and other benchmark adjustments.

N.A. = not available.

Appendix A. Definitions of Data Based on the Current Population Survey

Tables showing labor force status in sections I-III include provisional 1979 estimates of the civilian noninstitutional population 16 years and over. Population estimates are revised by the Bureau of the Census each year, and are incorporated into the CPS labor force levels used in the Federal-State Cooperative Program (Section IV). This adjustment affects the estimates of labor force, employment, and unemployment but does not affect unemployment rates, participation rates, or employment-population ratios.

Employed persons are all civilians who, during the survey week, did any work as paid employees or in their own business, or who worked 15 hours or more as unpaid workers in a family-operated enterprise. Persons temporarily absent from a job because of illness, bad weather, strikes, or for personal reasons are also counted as employed whether or not they were paid by their employer and whether or not they were seeking other jobs.

Unemployed persons are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be called back to a job from which they had been laid off, and those waiting to report to a new job within the next 30 days are also counted as unemployed.

Black and other races include all persons who identified themselves in the survey to be other than white. In the 1970 census, 89 percent of the black and other population group were black; the remainder were primarily American Indians, Alaskan Natives, and Asians and Pacific Islanders.

Hispanic origin refers to persons who identified themselves in the survey as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent. Hispanics are included among both the white and "black and other" groups. In the 1970 census, about 96 percent of the Hispanic population classified themselves as white. Estimates of sampling errors are not available for the Hispanic population for States and SMSA's. Except in the Miami area, the Hispanic population is smaller than the black and other population, and estimates for this group are likely to have a wider error range. Therefore, caution should be exercised in using these data.

Most people in the labor force work full time, and most of the unemployed are looking for full-time work. The *full-time labor force* consists of persons working on full-time schedules, persons involuntarily working part time (employed part time for economic reasons), and unemployed persons seeking full-time jobs. The *part-time labor force* consists of persons working part time voluntarily (1-34 hours), and unemployed persons seeking part-time work.

Estimates for the full- and part-time labor force are shown for the States and 30 SMSA's. However, because of the small numbers involved, reliable data for the black and other population are not available for all areas.

Occupational data are arranged according to the 10 major categories defined in the 1970 census. The occupation of the employed refers to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more.

Employment, unemployment, and the unemployment rate are shown for each of the States and the 30 large metropolitan areas for each occupational category. Data are not shown where the numbers are too small to yield reliable estimates. In tables showing data for cities, occupational groups have been combined in order to improve the quality of the estimates.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of seeking work.

The percent of the unemployed with short-term unemployment—less than 5 weeks or about 1 month—is contrasted with the percent unemployed 5-14 weeks,

15-26 weeks, and longer, including those unemployed for more than 1 year. Data are available for men, women, and white workers for many States, SMSA's, and large cities. However, because of the small size of the black and other population, estimates of the duration of unemployment for this group are available only for a limited number of areas. Estimates are not published in categories where there are fewer than 500 persons unemployed.

Reasons for unemployment are divided into four major groups: (1) Job losers—persons whose employment ended involuntarily who immediately began looking for work, and persons on layoff; (2) job leavers—persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) reentrants—persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) new entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

Total unemployment is distributed among the four categories by sex. The data have not been disaggregated by race and are not currently available for cities.

A more detailed description of the concepts used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey*, BLS Report 463.

Appendix B. Reliability of Estimates and Sampling Error Tables for CPS Estimates

The estimates presented in sections I-III of this report are based on the Current Population Survey (CPS)-a sample of the population rather than a complete count. Consequently, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as were used in the CPS. In general, the relative error of a sample estimate varies inversely with the size of the sample and the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a relatively larger error than an estimate for a subgroup constituting a large proportion of that population.

The proportion of the total population sampled in the CPS differs among the States. In general, the smaller the population, the larger the sampling proportion. For example, in Vermont approximately 1 in every 350 households is sampled, whereas in New York the sample covers about 1 in every 1,500 households. Differences in the probability of selection of households in each area are necessary to obtain statistically consistent total unemployment levels—with a maximum expected coefficient of variation of 10 percent or less, at a 6-percent unemployment rate.

Publication standards

The publication of data with comparable reliability for all areas, including States, SMSA's, and cities, therefore requires unique standards for minimum labor force, employment, and unemployment levels, based on the known differences in sampling ratios among these areas.

For subgroups in the population, the small numbers sampled could introduce another element of difference in reliability among the areas. Consequently, BLS requires that at least 30 sample cases be the basis for publication of distributions (either numerical levels or percentages) of data below the State or area totals. Table B-1 lists the minimum necessary base for publication of data in each of the States, the District of Columbia, and metropolitan areas.

Estimates are not shown in this report when they do not meet the minimum standard for the State or area listed in table B-1. In any particular table, the determining factor for publication is the size of the base of the distribution. In tables showing labor force status, the size of the labor force used to determine the unemployment rate for the particular group determines whether data for that group are published. In all other distributions, the determining factor is the total—which equals 100 percent. Data are not published for any cell with fewer than 500 persons or less than 1.0 percent in order to reduce errors caused by rounding of the data.

Using the sampling error tables

The sampling error tables (tables B-2 to B-21) can be used directly to develop 90-percent confidence intervals for sample estimates. They indicate the order of magnitude of the sampling error rather than the precise amount of error. Table B-2 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have a sampling error of 9,000, while an estimate of 100,000 unemployed persons for the same population group in Alabama has a sampling error of 13,000.

To calculate a 68-percent confidence interval (2 chances out of 3), multiply the sampling error by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 9,000. At 68-percent confidence, the error would be about 5,400 (9,000 X 0.6 = 5,400). At 95-percent confidence, the error would be about 11,000 (9,000 X 1.19 = 10,710).

To compute the error of a difference from the tables, an additional step is required. For instance, one may wish to know whether a change in the unemployment rate from 1978 to 1979 in a particular area is statistically "significant" or whether differences in the unemployment rate of two areas or population groups are statistically meaningful.

To test for the significance of a difference, the following formula should be used:

$$Z = \sqrt{a^2+b^2-C}$$

where: a = the error of one group or year
b = the error of another group or year
C = the covariance (or relationship) between a and b
Z = the error of the difference

Estimates for "C" term for areas in this report are not available. If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated. An example will show how this test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10 percent to 8 percent between 1978 and 1979 was significant. Assume that the labor force was about 100,000 in both years. Table B-8 gives the error for a 10.0-percent unemployment rate as 1.11 and for an 8.0-percent unemployment rate as 1.01. Using the formula described above, the following would result:

$$a = 1.11$$
$$b = 1.01$$
$$a^2 + b^2 = 2.25$$
$$\sqrt{2.25} = 1.50$$

Assuming a neglible "C" term, the error of the difference is 1.5. Since the actual change (2.0 percentage points) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error.

To derive a more precise sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-2 contains no sampling error for an estimate of 500,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 500,000 in Alabama:

$$Z = \left[\left[(S - B) \;/\; (A - B)\right] \times (X - Y)\right] + Y$$

where:
- A = published size immediately above the size desired (600,000)
- B = published size immediately below the size desired (400,000)
- S = size desired (500,000)
- X = error of A (28,000)
- Y = error of B (24,000)
- Z = error of S (26,000).

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "A" term is the highest value in the table and the "B" term becomes the next highest value.

Table B-1. Minimum bases required for publication of State or area data

(In thousands)

Appendix C. Geographic Boundary Definitions for the 30 Largest Metropolitan Areas

This appendix lists the boundary definitions of the 30 largest metropolitan areas in the United States, using the two methods by which the areas are defined for statistical purposes—Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's).

The Department of Labor has used LMA's for a number of years for various administrative and program purposes. Designed to measure conditions of the labor force within reasonable commuting distance of a large central city (or cities), the boundaries for almost all LMA's are the same as those for SMSA's as defined by the Office of Federal Statistical Policy and Standards. SMSA boundaries are defined using a set of uniform criteria, while LMA's are defined jointly by the State Employment Security agencies and the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

An SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are comprised of cities and towns, the minimum population size is 75,000.

The boundaries of SMSA's are occasionally revised. The table that follows compares the boundaries of the 30 largest SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. Estimates in section III refer to SMSA's while those in section IV refer to LMA's. LMA boundaries are revised periodically, and are published annually in the May issue of *Employment and Earnings*.

Table C-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition[1]	SMSA 1973 definition[2]	LMA definition[3]
Anaheim-Santa Ana-Garden Grove	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Du Page, Kane, Lake, McHenry, Will	Same	Same

Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Counties of Hood, Parker, and Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri portion: Counties of Cass, Clay, Jackson, Platte Kansas portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same
Minneapolis-St. Paul	Minnesota portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same

See footnotes at end of table.

Table C-1. Continued—Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition[1]	SMSA 1973 definition[2]	LMA definition[3]
New York	New York portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County, N.Y., and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey portion: Counties of Burlington, Camden, Gloucester	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	District of Columbia Virginia portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County, Md.	1973 definition

[1] 1970 area difinitions are used in section III, tables 9 and 17.

[2] 1973 area definitions are used in all tables in section III except as indicated in footnote 1, above.

[3] A Labor Market Area (LMA) is defined by the Department of Labor for program purposes. In most metropolitan areas, the LMA and SMSA are conterminous. All data in section IV refer to LMA's unless specifically noted.

Appendix D. Procedures for Estimating Employment and Unemployment Under the Federal-State Cooperative Program

Estimating methods

Employment and unemployment estimates for the 10 largest States (California, New York, Texas, Illinois, Pennsylvania, Ohio, Michigan, Florida, New Jersey, and Massachusetts) and two areas (New York City and the Los Angeles-Long Beach LMA) are taken directly from the Current Population Survey (CPS). For a description of CPS concepts, see the BLS periodical *Employment and Earnings*, Explanatory Note A, "Household Data."

Estimates for the remaining 40 States and the District of Columbia are prepared by State employment security agencies under standardized procedures developed by the Bureau of Labor Statistics. The estimates are prepared in several stages, as explained below.

Labor force and unemployment estimates for States, Labor Market Areas (LMA's), and other areas covered under Federal assistance programs are developed by State employment security agencies under a Federal-State cooperative program. The local unemployment estimates which are derived from standardized procedures developed by BLS are the basis for determining eligibility of an area for benefits under Federal programs such as the Comprehensive Employment and Training Act and the Public Works and Economic Development Act.

Preliminary estimate—employment

The total employment estimate is based primarily on data from the survey of establishments which produces an estimate of payroll employment. This place-of-work estimate must be adjusted to refer to place of residence as used in the CPS. Factors for adjusting from place of work to place of residence have been developed for the major categories of employment by class of worker and industry on the basis of employment relationships which existed at the time of the 1970 Decennial Census. These factors are applied to the payroll employment estimates for the current period to obtain adjusted employment estimates.

Estimates of employment for workers not covered by the payroll survey, such as agricultural workers and self-employed and unpaid family workers, are also developed using special surveys, national historical relationships, and census data.

Preliminary estimate—unemployment

In the current month, the estimate of unemployment is an aggregate of the estimates for each of three categories: (1) Persons who were previously employed in industries covered by State UI laws; (2) those previously employed in industries not covered by these laws; and (3) those who were either entering the labor force for the first time or reentering after a period of separation. This is referred to below as the UI-based estimate.

An estimate for those previously employed in covered industries is derived from a count of current unemployment insurance claimants, plus estimates of claimants whose benefits have been exhausted, those persons disqualified from receiving benefits for nonmonetary reasons (because they quit, were discharged for cause, etc., but would otherwise have been eligible), and persons who either filed claims late or not at all.

The estimate of those previously employed in industries not covered by UI is derived by applying to the employment estimate for each noncovered industry or class of worker subgroup in the State the ratio of covered unemployment to covered employment, weighted by factors reflecting national historical relationships.

For the third category, new entrants and reentrants into the labor force, a composite estimate is developed from equations that relate the total entrants into the labor force to the experienced unemployed and the experienced labor force. For each month, the estimate of entrants into the labor force is a function of: (a) the month of the year; (b) the level of the experienced unemployed; (c) the level of the experienced labor force; and (d) the proportion of the working-age population that is considered "youth." The composite estimate of total entrants is defined as:

$U = A(X+E) + BX$, where

U = total entrant unemployment

E = total employment

X = total experienced unemployment

A, B = synthetic factors incorporating seasonal variations and an assumed relationship between the proportion of youths in the working population and the historical relationship of entrants to the experienced unemployed (B factor) or the experienced labor force (A factor)

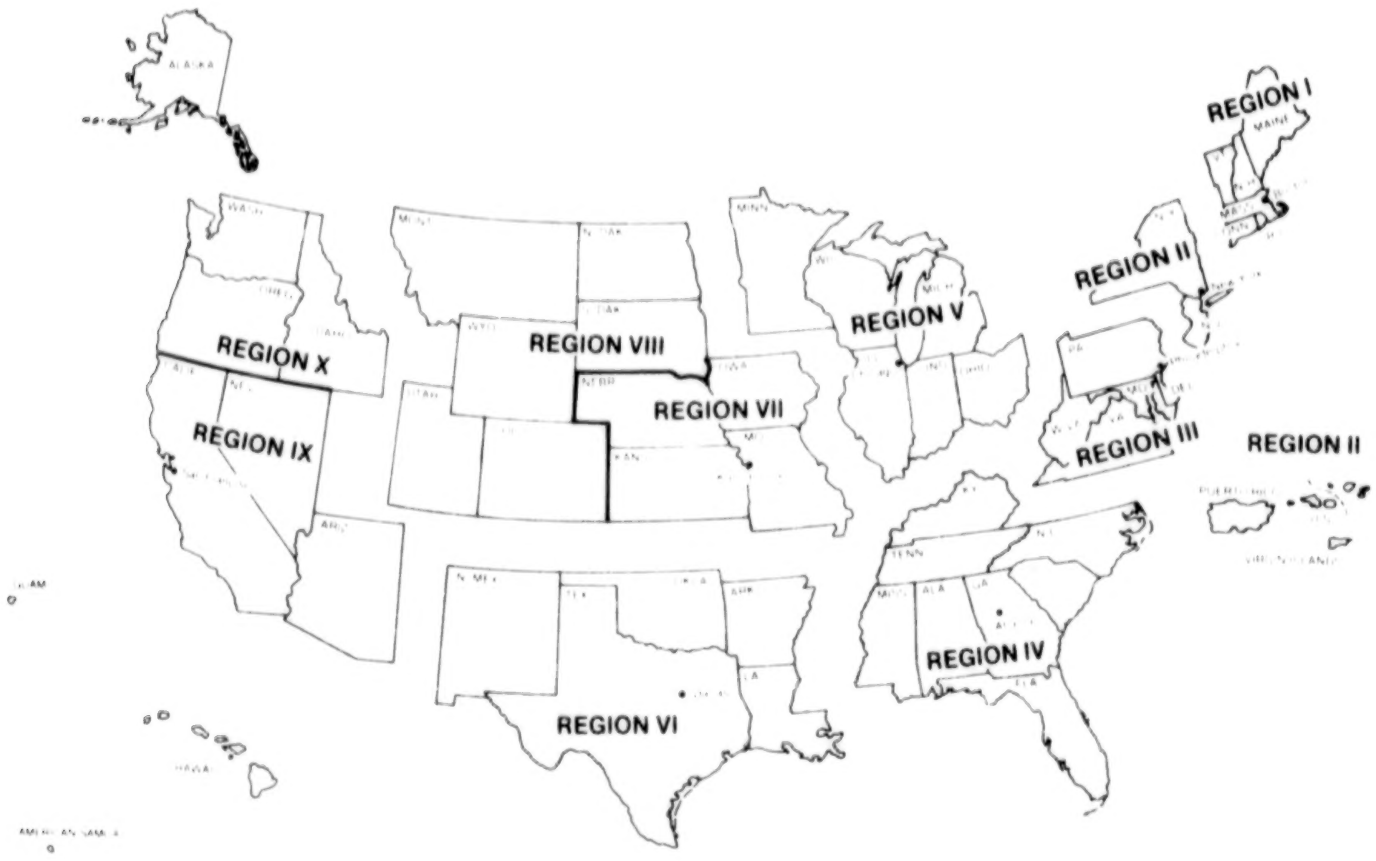
Correction factors

Correction factors are then applied at the State level to the UI-based estimates obtained above for each of the 40 States and District of Columbia. These correction factors are based on the ratio of the CPS to the UI-based estimates for the 6-month period ending in the current month (e.g., a 6-month moving average).

Sub-State adjustment for additivity

Independent estimates of employment and unemployment are prepared both for the State (obtained directly from the CPS in 10 large States or by the UI-based method in the remaining States), and labor market areas (LMA's) within the State. The total labor force included in the LMA's exhausts the geographic boundaries of the State. A proportional adjustment is applied to all sub-State LMA estimates to ensure that the sub-State estimates of employment and unemployment add to the independent State totals. In California and New York, which also have sub-State areas taken directly from the CPS, the additivity adjustment for the remaining areas is applied to the State total minus the direct CPS area.

Benchmark correction procedures



Once each year monthly estimates prepared by State employment security agencies using UI-based estimating procedures are adjusted, or benchmarked, by BLS to the annual average CPS estimates for the 40 States for which monthly CPS estimates are not available. This adjustment is necessary because the State-prepared estimates are not as reliable as the CPS annual averages due to differences in State UI laws, the structural limitations of the UI-based estimating method, and errors in the UI data.

The benchmarked estimates are produced in three stages. First, the monthly UI-based estimates are adjusted by the ratio of the CPS to the UI-based annual averages. Second, the difference between the ratio of annual averages for two consecutive years is wedged into the monthly estimates in order to minimize the disturbance to the original series. Finally, the second-stage estimates are forced into agreement with CPS annual averages. In the 10 States which use CPS estimates monthly, no benchmark correction is required, as the average of the 12 monthly State CPS estimates will equal the CPS annual averages.

The CPS estimates in the 10 large States and two large areas are adjusted each year to incorporate revised independent population estimates provided by the Bureau of the Census. These revised population estimates affect the levels of employment and unemployment, but do not affect the unemployment rates.

The estimates for LMA's in section IV have been adjusted to conform to CPS annual averages estimates for the States.

Preface

This bulletin presents data from the Current Population Survey (CPS) for States, 30 large metropolitan areas, and 11 central cities. It provides 1980 annual averages for the employed and the unemployed by demographic and economic characteristics which incorporate population counts projected from the 1970 decennial census. The estimates will be revised to incorporate population counts derived from the 1980 census and will be published as they become available.

Data for earlier years were published in the following reports: *Geographic Profile of Employment and Unemployment, 1975* (Report 481) and *1976* (Report 504); *State Profile of Employment and Unemployment, 1977* (Report 539); *Geographic Profile of Employment and Unemployment: States, 1978, Metropolitan Areas, 1977-78* (Report 571); and *Geographic Profile of Employment and Unemployment, 1979* (Report 619).

The official BLS estimates presented in section IV are developed from a Federal-State cooperative program and are used in the administration of Federal fund allocation programs. However, the data from the CPS for metropolitan areas and cities shown in section III are also used in the administration of section 202 (F) (2) (B) of the Comprehensive Employment and Training Act Amendments of 1978.

New data include hours of work and additional detail by sex, race, and marital status. Data for two metropolitan areas, New York and Minneapolis-St. Paul, are now based on the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area (SMSA). For further detail, see appendix C.

This bulletin was prepared in the Division of Local Area Unemployment Statistics by Richard Rosen, Anderia Thomas, Paul Hadlock, and Joya Ashe under the supervision of Sylvia Small. The tables were prepared under the direction of Fred Cronkhite. Sandy Grove, Denis Keyes, William L. Salvatore, and George Schreider shared in this effort.

Material in the publication is in the public domain and may, with appropriate credit, be reproduced without permission.

Geographic Profile of Employment and Unemployment, 1980

Data on unemployment in States and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program.

The CPS is the regular monthly survey of about 65,000 households from which the national unemployment rate is derived. (See appendix A for definitions and concepts in the CPS, and appendix B for a description of estimation procedures.) Annual average estimates of the demographic characteristics of the labor force (age, sex, and race) and the economic characteristics of the employed and unemployed are published for the 50 States, 30 large metropolitan areas, and 11 large cities, if they meet BLS standards of reliability for publication. (See appendix B for an explanation of the BLS standard for publication of CPS data.) Estimates for States are shown in section II and for metropolitan areas and cities in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error.[1] Error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections II and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections.

The Federal-State Cooperative Program provides monthly and annual average labor force and unemployment estimates for the 50 States and for 230 major labor market areas (section IV). These estimates are largely based upon administrative statistics from the unemployment insurance system, adjusted to conform to CPS annual estimates for the States. For the 10 largest States, however, both the monthly and annual estimates are obtained from the CPS. Appendix D describes the procedures for estimating employment and unemployment under this program.

[1] The CPS estimates in this report do not reflect the 1980 Census results. See appendix B for more details.

Section I. The Employment Situation in the States, 1980

Both labor force and enployment growth slowed in 1980 in most States, but the effect of the 1980 recession was most apparent in the North Central industrial States, where 45 percent of the increase in unemployment was concentrated. In four Western States, employment gains continued through the recession—Arizona, California, Colorado, and Nevada. However, of these Western States, only California had significant employment gains for black and other workers. Unemployment rates for black and other workers were higher than for whites in nearly all of the States for which data are published—and higher by 10 percentage points or more in 11 States.

Additional information on the differences in the employment situation among the States is given in the following text and tables, which include several new tables for which data were not available in earlier years. Expanded tables for 30 large metropolitan areas and 11 cities are also presented.

Because of changes in geographic boundary definitions in the Minneapolis-St. Paul and New York areas, users of these data should exercise caution when making over-the-year comparisons. Readers are also encouraged to use the tests of significance and error ranges provided in this and earlier *Geographic Profile* reports in order to assess the importance of changes.

Labor force changes

The rate of growth of the national labor force slowed to 1.8 percent in 1980, as the number of States with statistically significant labor force gains dropped to 14.[2] In 1979, when the national labor force increased by 2.5 percent, there were 19 States with significant gains. The 14 States where growth was significant in 1980 were primarily in the West and South. However, growth rates in several of the Western States were smaller than they had been a year before.

The labor force increased by nearly 4.5 percent or more in Arizona, Colorado, Nevada, and Oregon in 1980. In the other Western and Southern States where growth was significant, labor force gains were 2-4 percent. Outside these regions, Illinois and New Hampshire were the only two States with significant growth. (See text table 1.) In 1979, eight States in the North Central and Northeastern regions had significant labor force gains.

Not all demographic groups shared equally in these gains. Although the number of men and women in the labor force increased slightly in most States, their gains were not generally large enough to be statistically significant. Labor force gains for men were not significant in any State, while significant gains for women occurred in only three States—Arizona, Colorado, and Oregon.

The white labor force grew sharply (more than 5 percent) in four States—Alaska, Arizona, Colorado, and Mississippi. None of these States had significant labor force gains for black and other workers. However, the black and other labor force grew very sharply—over 20 percent—in Delaware, Nevada, and Oklahoma; and by about 9 percent in California.

Despite the long-term movement of black workers to the more industrialized States, the black and other labor force continued to have a large Southern base, with 46 percent residing in that region. (In 1970, about 50 percent resided in the Southern States.) California and New York had the largest black and other labor force; about 10 percent of the national total were in each of the two States. Additionally, Florida and Texas together accounted for more than 10 percent of the black and other labor force.

The black and other labor force includes, in addition to blacks, American Indians, Alaskan Natives, Asians and Pacific Islanders, and all other races other than white. While a majority of the black and other group is "black" in most States, in several West North Central States and most of the Mountain States, a majority of the black and other population is American Indian. In Alaska, the black and other group is primarily Alaskan Natives, while in Hawaii, Asians and Pacific Islanders constitute the largest share of the population.

Labor force participation rates. The labor force participation rate—the percent of the civilian noninstitutional population 16 years and over who were either employed or unemployed in 1980—ranged from about 55 percent in Florida and West Virginia to 70 percent or more in four Western States—Alaska, Colorado, Nevada, and Wyoming. Nationally, the labor force participation rate

[2] The word "significant" in this report means that a statistical test of significance has been performed on the data and that the year-to-year change in a sample estimate has been found to be "statistically significant." This method takes into account the statistical error (sampling variability) of estimates, based on the sample in each State. See appendix B for further discussion.

Text table 1. Civilian labor force by State ranked by percent change, 1979 and 1980 annual averages

State	Labor force (in thousands)		Percent change	State	Labor force (in thousands)		Percent change
	1979	1980			1979	1980	
Arizona	1,052	1,126	7.0	North Dakota	303	309	2.0
Colorado	1,386	1,474	6.3	Arkansas	954	972	1.9
Nevada	358	376	5.0	Delaware	275	280	1.8
Oregon	1,217	1,271	4.4	North Carolina	2,692	2,741	1.8
Alaska	180	187	3.9	Tennessee	1,979	2,015	1.8
Utah	584	607	3.9				
Mississippi	986	1,023	3.8	Pennsylvania	5,296	5,368	1.4
Kentucky	1,593	1,621	3.7	Montana	369	374	1.4
New Hampshire	445	461	3.6	New Jersey	3,537	3,582	1.3
Oklahoma	1,278	1,325	3.7	Iowa	1,432	1,449	1.2
Wyoming	224	232	3.6	New Mexico	537	543	1.1
Texas	6,244	6,412	2.7	Alabama	1,625	1,642	1.1
Rhode Island	450	462	2.7	Ohio	5,036	5,086	1.0
Louisiana	1,679	1,723	2.6				
Maine	488	500	2.5	Washington	1,892	1,908	.8
Minnesota	2,064	2,116	2.5	Nebraska	772	777	.6
West Virginia	750	768	2.4	Idaho	422	424	.5
Florida	3,835	3,925	2.3	Indiana	2,610	2,620	.4
Illinois	5,331	5,447	2.2	Hawaii	399	400	.3
Georgia	2,334	2,385	2.2	Missouri	2,292	2,295	.1
				Wisconsin	2,381	2,401	.1
				Massachusetts	2,891	2,893	.1
Connecticut	1,581	1,616	2.2	Kansas	1,197	1,198	.1
Vermont	240	245	2.1	South Carolina	1,306	1,306	.0
Virginia	2,477	2,530	2.1	South Dakota	337	337	.0
California	10,968	11,203	2.1	New York	8,008	7,992	-.2
Maryland	2,092	2,133	2.0	Michigan	4,313	4,298	-.3

averaged 63.8 percent in 1980. Four North Central farm States (Kansas, Minnesota, South Dakota, and Wisconsin) were among the highest in labor force participation, along with Connecticut and New Hampshire in the Northeast, and Maryland in the South. Labor force attachment was generally lowest in the South, as 7 of the 10 States with the lowest participation rates were in this region. (See text table 2.)

Participation of adult men ranged from a low of 69 percent in Florida—where many retirees reside—up to 86 percent in Wyoming. The labor force attachment of adult women continued to be well below that of adult men in most States but ranged widely, from below 40 percent in West Virginia to over 60 percent in Alaska. Teenage participation rates in the States varied from about 44 percent in Alabama to nearly 72 percent in Minnesota. Regionally, participation of teenagers in the labor force was lowest in the South. (Six of the seven States where participation rates were below 50 percent were in this region.) Participation was highest in the North Central farm States.

The labor force participation rate for black and other workers (61.2 percent) averaged 2.6 percentage points below the average for all workers in 1980. In several States where American Indians or Alaskan Natives constituted a major proportion of the black and other population (Alaska, Montana, North Dakota, Oklahoma, and South Dakota), participation rates for the black and other group were even lower—less than 55 percent.

Employment changes

Nationally, employment rose 0.3 percent to 97.3 million in 1980, the smallest increase in any year since 1975. In only four Western States were employment gains statistically significant—Arizona, California, Colorado, and Nevada. In 1979, when the increase in national employment was 2.7 percent, there were significant employment gains in 17 States.

Employment fell significantly in 1980 in two States—Michigan (220,000 or 5.6 percent) and Indiana (75,000 or 3.1 percent). No State had a significant employment decline in 1979. About two-thirds of the 1980 employment decline in Michigan was among white workers. In Indiana, nearly all of the decline was among white workers.

Among the States where employment grew sharply, California showed a nearly equal increase for white and black and other workers. In Arizona, however, while gains for white workers were very sharp, employment among black and other workers declined. Employment among white workers also rose significantly (5 percent or more) in Alaska, Colorado, and Mississippi, while changes for black and other workers were not large enough to be significant.

Text table 2. Civilian labor force participation rates for major demographic groups by State, 1980 annual averages

State	Total	White	Black and other	Adult men	Adult women	Teen-agers
United States	63.8	64.2	61.2	79.4	51.4	56.9
Alabama	59.2	60.4	55.8	75.8	48.0	43.9

Wyoming	70.0	70.2	(1)	86.3	55.2	63.3

[1] Estimate not sufficiently large to meet BLS standards of reliability for the State, based on the sample in the State.

Employment of men held relatively steady in 1980, except in the three industrial North Central States of Indiana, Michigan, and Ohio, where very sharp employment declines for men reflected the 1980 auto production slowdown. Female employment did not decline significantly in any State, while substantial gains occurred in only two States, Arizona and Colorado—many fewer than in recent years.

Occupational distribution of employment. White-collar workers outnumbered blue-collar workers in all States except West Virginia in 1980. Among men, craft workers continued to constitute the largest group (about one-fifth), except in four States—Delaware, Maryland,

New Mexico, and New York—where the number of professional and technical workers was greater. Female employment tended to be more concentrated, with one-third of the total in clerical occupations in most States. Service occupations accounted for the next largest category—about one-fifth.

Hours of work and full-time vs. part-time status. Among persons employed in nonagricultural wage and salary jobs, average hours of work ranged from just under 37 in Massachusetts and Rhode Island to 40 in Alaska. On the average, 4 out of every 5 employed persons in most States had full-time jobs in 1980. Among full-time workers, average hours were lowest in New York (41.9) and highest in Alaska (45.4).

The part-time labor force, which consists of persons voluntarily working less than 35 hours per week and those unemployed seeking part-time jobs, constituted about 15 percent of the national labor force in 1980. In six States (Alabama, Alaska, Nevada, South Carolina, Tennessee, and West Virginia), this percentage was smaller (12 percent or less).

States with higher part-time work forces (18 percent or more) were Minnesota, South Dakota, Utah, and Wisconsin.

Unemployment

Unemployment rate increases between 1979 and 1980 were widespread among the States, as the national unemployment rate rose sharply, from 5.8 to 7.1 percent. There were significant increases in 32 States in all regions, although some regions were affected more than others. (See chart 1.)

In nine States, including five industrial North Central States (Illinois, Indiana, Ohio, Michigan, and Wisconsin) where cutbacks were prevalent in transportation equipment and related durable goods manufacturing industries, the increase was more than 2.0 percentage points. These five States accounted for nearly 45 percent of the national increase in unemployment. Unemployment rates also rose sharply in the adjacent States of Kentucky, West Virginia, and Missouri, and in Idaho. In 1979, only Michigan had a significant increase in unemployment, as the automobile production slowdown began.

Hawaii was the only State where unemployment fell significantly during 1980.

Five States had unemployment rates higher than 8.5 percent in 1980: Michigan had the highest rate, 12.6 percent, followed by Alaska, Indiana, West Virginia, and Alabama. (See chart 2.) Only Alaska had a rate as high as 8.5 percent in 1979.

By contrast, there were three Northwestern farm States with unemployment rates lower than 4.5 percent in 1980 (Kansas, Nebraska, and Wyoming), compared with eleven States in 1979. However, even in these three States, 1980 unemployment rates were about 1.0 percentage point higher than in 1979.

Unemployment by demographic group. Unemployment rates for both white and black and other workers were very high in the States most directly affected by the slowdown in automobile and related manufacturing industries. Unemployment rates were over 7 percent for white workers in most of the industrial North Central States and, in Michigan, over 11 percent. By contrast, unemployment rates for white workers were below 5 percent in the central farm belt States, from North Dakota down to Texas, and in several Southern States.

Unemployment rates for black and other workers were at least 10 percent in 41 of the 44 States where separate rates are published for 1980, including 16 States with rates of at least 15 percent. The highest rates were in Michigan, Montana, and North Dakota (over 20 percent). Only in Hawaii was the unemployment rate for black and other workers under 5 percent. Asians and Pacific Islanders constitute a majority of the black and other population in this State.

Thus, despite increases for whites, unemployment rates for black and other workers continued to be significantly higher than those for white workers in nearly all States. (See chart 3.) Nationally, the 1980 unemployment rate for black and other workers (13.2 percent) was about 7 percentage points higher than for whites. In 11 States, including 8 of 12 in the North Central region, the unemployment rate for black and other workers was at least 10 percentage points higher than for whites. Montana, Tennessee, and Pennsylvania were the other States where the unemployment differential was this large.

Despite the relatively high unemployment rates for black and other workers in the North Central region, 43 percent of their total unemployed were in the South, reflecting the concentration of their population in this region. The black and other group accounted for more than half of the unemployed in Mississippi and more than one-third in seven other Southern States, and in Alaska and Hawaii. (See chart 4.) In most of these States, their share of unemployment was close to double their representation in the labor force.

Duration of unemployment. The rise in unemployment during 1980 was accompanied by an increase in the duration of unemployment—the average length of a continuous period of unemployment during the year. Nationally, 10.8 percent of the unemployed during an average month had been out of work 27 weeks or more in 1980, compared with 8.7 percent in 1979. Such long-term unemployment accounted for more than 10 percent of the total in 17 States in 1980.

There was a sharp drop in the number of States where the duration of unemployment was relatively short. In

Chart 1. Changes in State unemployment rates, 1979-80

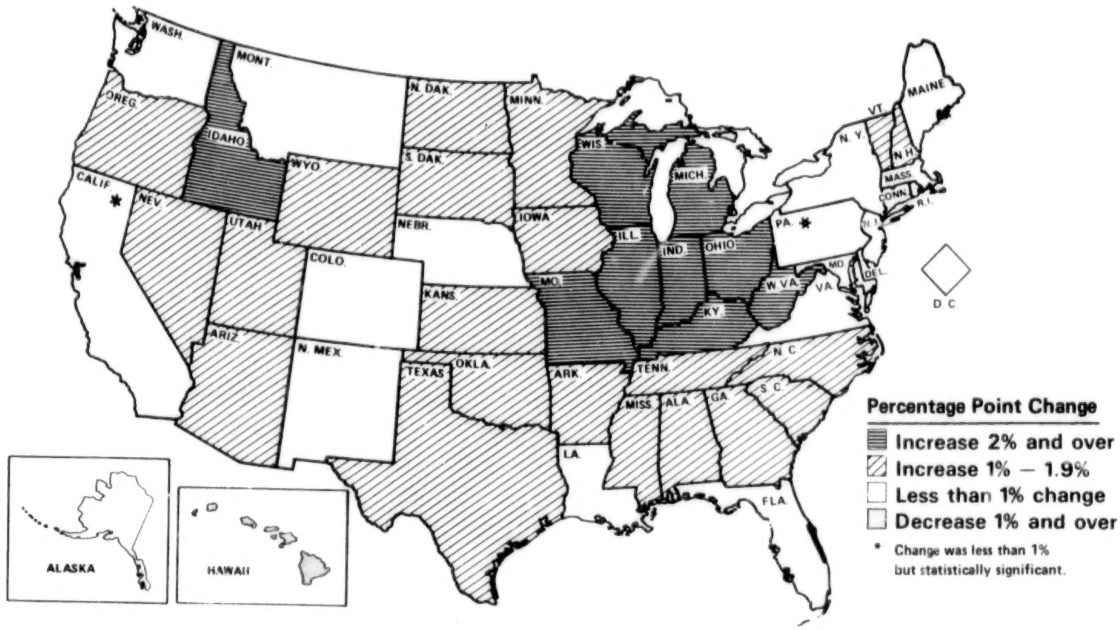

Chart 2. Unemployment rates by State, 1980 annual averages

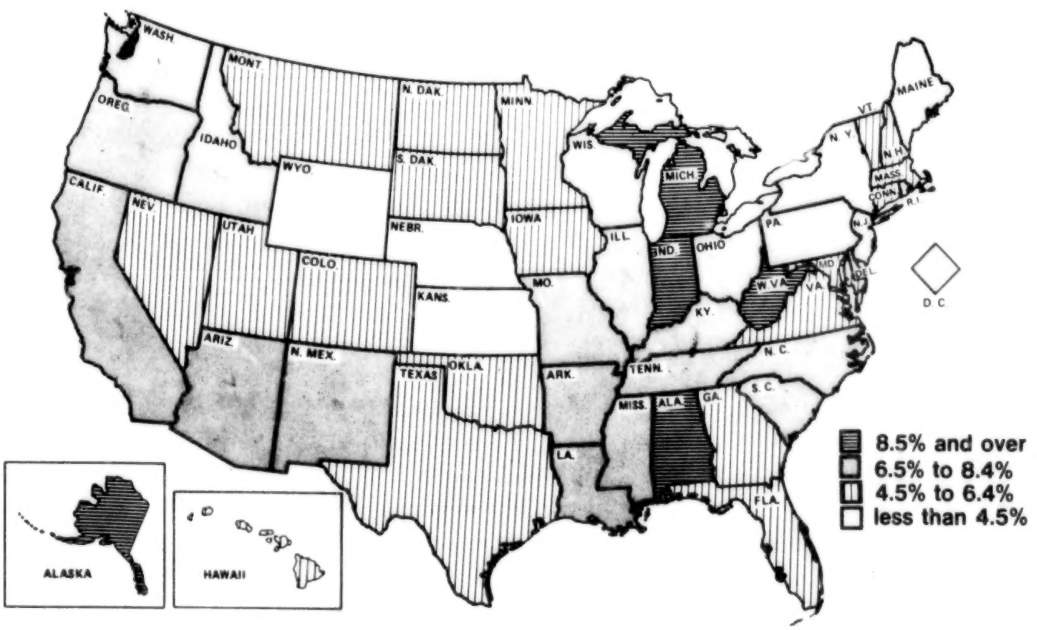

Chart 3. Unemployment rate differences: Black and other vs. white, 1980 annual averages

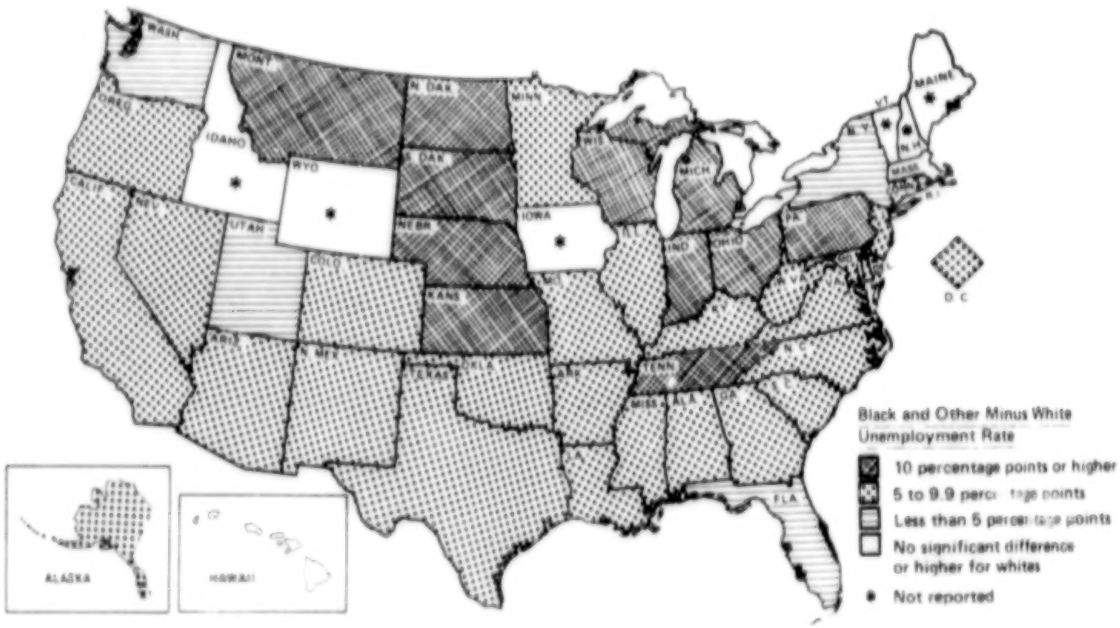

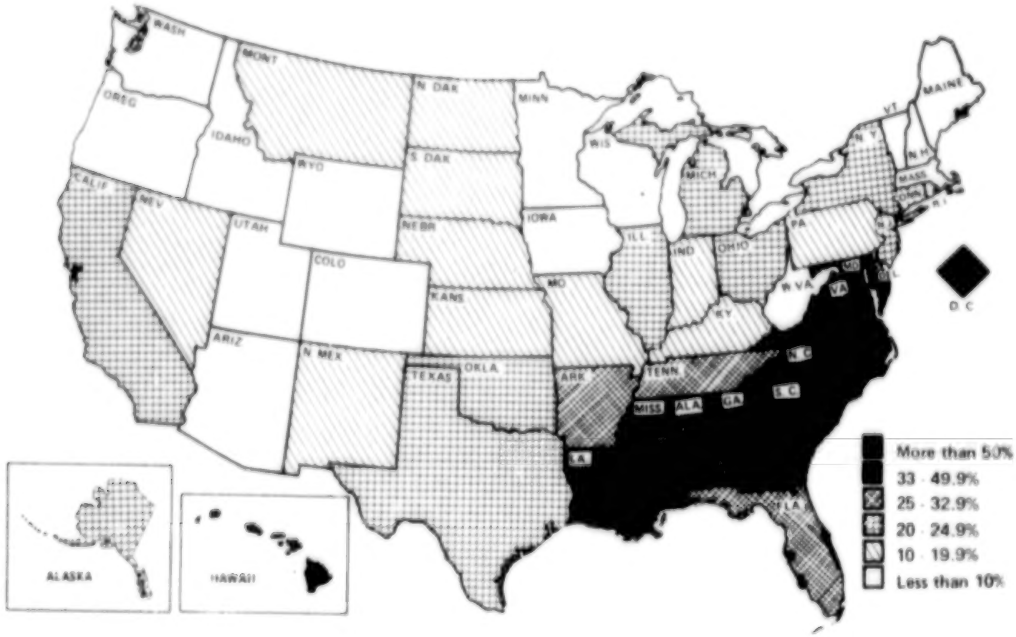

Chart 4. Percent black and other of total unemployment in the State, 1980 annual averages

1980 there were 11 States, primarily in the South and West, where duration of unemployment averaged less than 5 weeks, compared with 26 States in 1979:

State	*Percent unemployed less than 5 weeks, 1980 annual averages*
Wyoming	61.8
Texas	58.4
Oklahoma	55.0
Utah	54.4
Hawaii	53.2
Colorado	52.7
Nebraska	52.3
Nevada	51.8
Arizona	51.7
Georgia	50.4
Florida	50.2

Unemployment by reason. The number of job losers—persons who were laid off or those whose employment was otherwise terminated involuntarily—rose markedly from 1979 to 1980, from 2.6 to 3.9 million nationwide. Job losers accounted for 52 percent of total unemployment in 1980, compared with 43 percent in 1979. While there were slight increases in the number of persons who voluntarily left their previous job (job leavers), or who were entering the labor market for the first time or reentering after a period of separation (new entrants and reentrants), each of these groups represented smaller shares of the Nation's unemployment in 1980 than in 1979.

Job losers constituted at least 55 percent of the unemployed in 11 States, primarily in the North Central and Northeastern part of the Nation. In 1979, only Rhode Island had as high a proportion.

By contrast, in many of the rapidly growing Southern and Mountain States, job leavers and reentrants constituted a larger-than-average share of unemployment. For example, job leavers were 12 percent of total unemployment nationally in 1980, but accounted for at least 18 percent in each of seven Southern and Mountain States—Arizona, Colorado, Nevada, Oklahoma, Texas, Utah, and Wyoming. Reentrants, about 25 percent of unemployment nationally, accounted for over one-third of the total in seven States, primarily in the Mountain and Pacific regions—Alaska, Colorado, Montana, New Mexico, Oklahoma, Utah, and Wyoming.

Section II. State Estimates from the Current Population Survey

Table 1. Labor force status of the civilian noninstitutional population 16 years and over by State, sex, age, race, and marital status, 1980 annual averages

(Numbers in thousands)

Women, spouse present[2]	109	57	52.2	54	50.0	2	4.3	3.2 - 5.4

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] Differences in population levels occur because of independent estimation of males and females.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular State based on the sample in that State. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Less than 500 persons or less than 0.05 percent.

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular State, based on the sample in the State. See appendix B.

NOTE: Numbers may not add to totals because of rounding.

Table 3. Labor force status of the experienced[1] civilian labor force by occupation and State, 1980 annual averages—Continued

(Numbers in thousands)

Population group and State	Total	White-collar workers					Blue-collar workers					Service workers	Farm workers
		Total	Professional and technical workers	Managers and administrators, except farm	Sales workers	Clerical workers	Total	Craft and kindred workers	Operatives, except transport	Transport equipment operatives	Nonfarm laborers		
Unemployment rate—Continued													
South Dakota	4.4	2.7	1.9	1.6	2.4	4.2	8.6	7.5	7.8	5.2	14.5	6.4	0.7
Tennessee	6.5	3.4	1.9	2.0	3.6	5.3	9.8	3.8	12.8	6.0	18.5	7.2	4.3
Texas	4.6	2.9	2.0	1.3	3.6	4.3	6.2	3.8	8.2	4.5	10.1	7.9	3.1
Utah	5.7	3.7	2.5	1.7	5.2	5.5	8.4	6.8	9.7	6.2	12.0	7.4	5.4
Vermont	5.9	3.9	3.1	2.7	4.3	5.4	9.5	7.4	10.6	10.8	12.0	6.0	3.2
Virginia	4.3	2.9	2.2	2.0	2.5	4.3	5.9	4.3	7.1	2.9	9.6	6.3	[3]
Washington	6.9	4.1	2.6	3.2	4.4	6.0	10.8	9.3	11.5	8.6	15.3	8.7	[3]
West Virginia	8.3	4.5	2.1	3.1	6.2	6.3	11.3	8.5	10.9	11.6	18.1	10.4	[3]
Wisconsin	6.3	3.4	2.6	3.0	3.7	4.1	10.5	6.1	12.9	10.4	15.1	6.1	3.5
Wyoming	3.8	2.8	1.8	1.7	5.6	3.7	4.8	3.2	5.7	3.5	10.2	5.9	.8

[1] Excludes persons with no previous full-time work experience.

[2] Data are not shown when they do not meet BLS publication standards of reliability for the particular State, based on the sample in the State. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to subtotals because of rounding.

Table 4. Occupational distribution of employment by State, sex, and race, 1980 annual averages

(Percent of total employment)

[1] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to total because of rounding. Data are not shown separately for black and other races when the employment estimate for black and other races is not sufficiently large to meet BLS publication standards of reliability for the particular State, based on the sample size in that State. See appendix B.

Table 5. Nonagricultural wage and salary employment by hours of work by State, 1980 annual averages

(Numbers in thousands)

Virginia	395	213	53.9	185	46.9	28	13.0	9.4 - 16.6

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular State based on the sample in that State. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

California	361	207	57.4	165	45.6	42	20.5	17.4 - 23.6
New Mexico	40	20	50.0	15	37.6	5	24.8	19.2 - 30.5
Texas	245	132	53.7	105	43.0	26	20.0	15.7 - 24.4

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular State based on the sample in that State. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Table 11. Full- and part-time status of the Hispanic labor force, selected States, by sex, 1980 annual averages

(Numbers in thousands)

Population group and State	Full-time labor force					Part-time labor force

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] Differences in population levels occur because of independent estimation of males and females.

[3] These data are for the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area for which estimates were published in earlier years. The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Table 14. Full- and part-time status of the civilian labor force 16 years and over in 30 large metropolitan areas and 11 large cities by sex, age, and race, 1980 annual averages

(Numbers in thousands)

Population group and area	Full-time labor force					Part-time labor force

Philadelphia	232	171	14	46	19.9	[3]	[3]	[3]	[3]
St. Louis	69	53	4	12	17.1	[3]	[3]	[3]	[3]

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Area (LMA). The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

[4] Less than 500 persons or less than 0.05 percent.

NOTE: Numbers may not add to totals because of rounding.

[1] Excludes persons with no previous full-time work experience.

[2] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Area (LMA). The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

[3] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

[4] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to subtotals because of rounding or because farm workers are included in totals but not shown separately.

Table 16. Occupational distribution of employment in 30 large metropolitan areas and 11 large cities by sex and race, 1980 annual averages

(Percent of total employment)

[1] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Area (LMA). The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

[2] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to total because of rounding or because farm workers are included in totals but are not shown separately. Data are not shown separately for black and other races when the employment estimate for black and other races is not sufficiently large to meet BLS publication standards of reliability for the particular area, based on the sample size in that area. See appendix B.

Table 17. Nonagricultural wage and salary employment by hours of work in 30 large meropolitan areas and 11 large cities, 1980 annual averages

(Numbers in thousands)

Population group and area	Total at work	Persons at work by hours							Average hours	
		1-14 hours	15-29 hours	30-34 hours	35-39 hours	40 hours	41-48 hours	49 hours and over	Total	Full-time schedules[1]

St. Louis	81	39	47.5	33	39.9	6	16.0	12.8 - 19.3

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Area (LMA). The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

NOTE: Data are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Section IV. Unemployment Estimates for States and Large Labor Market Areas

The tables that follow provide monthly unemployment rates for States and the District of Columbia, and annual average labor force and unemployment estimates for States and 230 Labor Market Areas (LMA's). These estimates are produced for use in the administration of the Comprehensive Employment and Training Act of 1973, as amended (CETA), the Public Works and Economic Development Act of 1965, as amended, the Buy American Act (Executive Order 10582), and Defense Manpower Policy No. 4A.

These data are the product of a Federal-State cooperative program in which State employment security agencies prepare labor force and unemployment estimates under concepts, definitions, and technical procedures established by the Bureau of Labor Statistics.

In 10 large States (California, Florida, Illinois, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Texas) and two areas (New York City and the Los Angeles-Long Beach LMA, the monthly estimates are obtained directly from the Current Population Survey (CPS), the monthly survey of households used to measure unemployment nationally. These State and area CPS estimates meet the BLS standard of reliability (10-percent coefficient of variation on the level of unemployment at a 6-percent rate of unemployment at one standard error) on a monthly basis. In the remaining 40 States and the District of Columbia, an initial estimate of employment and unemployment is developed using data from the unemployment insurance (UI) system together with estimates of persons not covered by UI.

A 6-month moving average of the CPS to the UI-based estimate is applied to the current month's estimate to bring the UI-based State estimate more into conformity with national definitions of employment and unemployment.

Estimates for the Labor Market Areas (except for Los Angeles-Long Beach) are obtained from the UI-based estimates adjusted to the State employment and unemployment totals.

Once each year, the monthly employment and unemployment estimates for the 10 large States and two large areas are adjusted to incorporate revised independent population estimates. The UI-based estimates in the remaining States and the District of Columbia are adjusted or "benchmarked" to annual averages from the CPS, which meet the BLS reliability standard on an annual basis. Estimates for areas within the States are then adjusted so that the sub-State components add to the statewide totals. The LMA estimates in the following tables have been adjusted to State annual average totals from the CPS.

Monthly estimates for the States and LMA's shown here are published as table E-1 in *Employment and Earnings*, and as a monthly BLS news release, "State and Metropolitan Area Unemployment."

Estimates for smaller LMA's, all counties, cities of 25,000 population or more, and other jurisdictions for administrative purposes (prime sponsors, program agents, etc.) are published monthly through the Government Printing Office in *Employment and Unemployment in States and Local Areas*. However, because of the small size of many of the areas, as well as the limitations of the data inputs, users are cautioned that these data should be used only to fulfill the program needs for which the estimates were developed.

Subscription information should be addressed to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Appendix A provides data mandated under the 1978 Amendments to the CETA Act and under Defense Manpower Policy No. 4A, which require that BLS publish CPS-based data for the 30 large metropolitan areas shown in section III, in addition to estimates for the same areas based on the Federal-State Cooperative Program shown in this section.

Table 24. Monthly CPS unemployment rates for 10 large States, 1970-80[1]

[1] Includes interstate portion of area located in adjacent State.

NOTE: Annual average State data are obtained directly from the Current Population Survey. Estimates for sub-state areas, except New York City and Los Angeles-Long Beach, are based on administrative statistics adjusted to the statewide totals. See appendix D for a description of the estimating methods.

N.A. = not available.

SOURCE: Current Population Survey and Cooperating State Employment Security Agencies listed on the inside back cover.

Appendix A. Definitions of Data Derived from the Current Population Survey

Tables showing labor force status in sections I-III include provisional estimates of the civilian noninstitutional population 16 years and over in 1980 as well as data on the civilian labor force (the total of the employed and the unemployed), unemployment rates, and labor force participation rates. Population estimates are revised by the U.S. Bureau of the Census each year. The revised population estimates are incorporated into the CPS labor force levels used in the Federal-State Cooperative Program. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect unemployment rates, participation rates, or employment-population ratios.

Employed persons are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are counted as employed whether they were paid by their employer or were seeking other jobs.

Unemployed persons are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, and those waiting to report to a new job within the next 30 days, are also counted as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of jobseeking.

In this report, the percent of the unemployed with short-term unemployment—less than 5 weeks or about 1 month—is contrasted with the percent unemployed 5–14 weeks, 15–26 weeks, 27–51 weeks, and 52 weeks and over. Data are available by sex, age, and race in States, metropolitan areas, and large cities. However, because of the small size of the teenage and black and other population in many areas, estimates of the duration of unemployment for these demographic groups are available only for a limited number of areas. Estimates are not published for categories in which there are fewer than 500 persons unemployed.

Reasons for unemployment are divided into four major groups: (1) Job losers— persons whose employment ended involuntarily who immediately began looking for work, and persons on layoff; (2) Job leavers— persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) Reentrants— persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) New entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

The full-time labor force consists of persons working on full-time schedules, persons involuntarily working part time (employed part time for economic reasons), and unemployed persons seeking full-time jobs. "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work.

The part-time labor force consists of persons working part time voluntarily (1-34 hours), and unemployed persons seeking part-time work. Persons with a job but not at work are classified according to their usual full- or part-time status.

Estimates for the full-time and part-time labor force are shown for the States and 30 metropolitan areas. However, because of the small numbers involved, reliable data for the black and other population are not available for all areas.

Occupational data for the employed refer to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. The classifications of occupations used in data derived from the CPS are as defined in the 1970 Census.

Employment, unemployment, and the unemployment rate are shown for each of the States and the 30 large metropolitan areas for each occupational category. Data are not shown where the numbers are too small to yield reliable estimates. In tables showing data for cities, occupational groups have been combined in order to improve the quality of the estimates.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week but who were off on the Columbus Day holiday would be reported as working 32 hours even though they were paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week. However, all the hours are credited to the major job.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a job but not at work." Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons.

White and *black and other* are terms used to describe the race of workers. The "black and other" category includes all persons who identified themselves in the enumeration process to be other than white. At the time of the 1970 Census of Population, 89 percent of the black-and-other population group were black; the remainder were primarily American Indians, Alaskan Natives, and Asians and Pacific Islanders. The term "black" is used in this report when the relevant data are provided exclusively for the black population.

Hispanic origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent. Hispanics may be of either race; hence, they are included in the data for both the white and the "black and other" population. Estimates of sampling errors in this report for the Hispanic-origin population are based upon those for the black and other population. However, since the Hispanic population is smaller, estimates for this group are likely to have a wider error range. Therefore, caution should be exercised in making comparisons using these data.

A more detailed description of the definitions used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey*, BLS Report 463.

Appendix B. CPS Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in sections I-III of this report are based on annual averages of monthly data obtained from the Current Population Survey (CPS)—a sample survey of the civilian noninstitutional population.[1] The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, marital status, and occupation. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian noninstitutional population. During 1980, over 71,000 occupied housing units were eligible for interview each month; all but about 6,000 of these units were in the national CPS sample. Respondents are interviewed to obtain information about the employment status of each household member 16 years of age and over for the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; persons under 16 are excluded from the population and labor force statistics shown in this report.

Sampling procedures

The sample design used for the CPS is based to a large extent on the distribution of the population reported in the most recent decennial census. The current sample encompasses 629 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia. These areas were selected by dividing the entire area of the United States into 1,931 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or a number of contiguous counties. Each of the standard metropolitan statistical areas (SMSA's) defined as of the 1970 Census constitutes a separate PSU.

To improve the efficiency of the sample, the 1,931 PSU's were grouped into strata. PSU's in strata by themselves are self-representing (SR), and generally are the most populated PSU's in each State. Other strata were formed by combining PSU's which were similar in such characteristics as geographic region, population density and growth, proportion nonwhite, principal industry, number of farms, etc. PSU's selected from these strata are non-self-representing (NSR), since each represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected. These are administrative units designated in the 1970 Census and contain, on the average, about 300 households. Second, clusters of approximately four addresses to be enumerated within each designated ED are selected. Whenever possible, the four units are contiguous.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to avoid the poor cooperation which may result from interviewing a constant panel indefinitely. Another reason for replacing households is to reduce the cumulative effect of response biases which are sometimes observed when the same persons are interviewed indefinitely. The rotation plan provides for three-fourths of the sample to be identical from 1 month to the next and one-half to be identical with the same month a year earlier.

Prior to the State and area sample supplementations in 1976 and 1980, the sampling ratio, or probability of selecting each household, was the same in each State, approximately 1 in 1,500. The sampling ratio is automatically modified over time so that the size of the sample is held relatively constant despite the overall growth of the population. In 1976, the samples in 23 small States and Washington, D.C. were supplemented to improve the reliability of the estimates. In 1980, additional households were added to the samples in selected States and areas for this same purpose. This supplementation affected the sampling ratios in these States. Consequently, the probability of selecting a particular

[1] For a technical description of the CPS sampling and estimation procedures and variance estimation procedures, see Technical Paper 40, *The Current Population Survey Design and Methodology*, January 1978, published by the Bureau of the Census.

household in the sample currently varies considerably from State to State. (See section on reliability standards).

CPS estimating methods

Under the estimating methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The CPS estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

The basic weights, which are the inverse of the sampling ratios, are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, unavailability of the respondent, or other reasons. The proportion of sample households not interviewed generally varies from 4 to 5 percent, depending on weather, vacations, etc.

2. *Ratio estimates.* The distribution of the population selected for the sample may differ somewhat, by chance, from that of the population as a whole in such characteristics as age, race, sex, and residence.

   Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

   a. *First-stage ratio estimate.* As explained above, NSR areas are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the 1970 Census between the distribution of the population by race and residence in the NSR sample areas and the known distribution in the entire area represented by each of these NSR areas. The procedure is performed twice, once for the four census regions and then for each of the 46 States which contain NSR areas.

   b. *Second-stage ratio estimate.* This stage is designed to adjust the first-stage estimates for sample coverage of the population, and is conducted as follows. First, the sample estimates are adjusted within each State and the District of Columbia to an independent estimate of the population 16 years and over for that State. The second step involves persons of black and other races only and is an adjustment to independent estimates of 48 age-sex-race categories for the Nation as a whole. The third step, applied to all sample persons, is used to adjust the State totals to independent population estimates for 68 national age-sex-race groups. When completed, this procedure insures that the sample population estimates, both for the States and the national age-sex-race categories, will be virtually equal to the independent population estimates in these categories.

   The independent State controls for the civilian noninstitutional population 16 years and over are an arithmetic extrapolation of the trend in their growth from the April 1, 1970, census count through the latest available July 1 estimate, adjusted as a last step to a current estimate of the U.S. population. A description of the methodology used to derive the national age-sex-race estimates and State totals may be obtained from the Chief of the Population Division, U.S. Bureau of the Census, Washington, D.C. 20233.

3. *Composite estimate procedure.* In deriving the final statistics for a given month, a composite estimating procedure is used which takes account of net changes in the sample results from the previous month for the continuing households of the sample (75 percent), as well as the sample results from all households for the current month. Almost all estimates of month-to-month change are improved by this procedure, and most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this report are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumerations but do not measure any systematic biases in data. In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a smaller absolute (and larger relative) error than an estimate for a subgroup constituting a large proportion of that same population.

Reliability standards

As previously mentioned, the proportion of the total population sampled in the CPS differs among the States. In general, the smaller the population, the larger the sampling proportion. For example, in Vermont approximately 1 in every 200 households was sampled in 1980, whereas in New York the sample covered about 1 in every 1,500 households. Nevertheless, the size of the sample in New York is larger than in Vermont because the State CPS data are weighted to produce national estimates, and because New York contains a much larger proportion of the national population than Vermont.

Differences in the probability of selection of households in each area (i.e., sampling ratios) are necessary

to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6-percent unemployment rate. Before CPS labor force data for a State or area can be used in the Federal-State cooperative program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability. (See section IV.)

Publication standards for State and area CPS data

The publication of data based on a comparable minimum standard of reliability for all areas, including States, SMSA's, and cities, requires unique standards for minimum labor force, employment, and unemployment levels, based on the known differences in sampling ratios among these areas. To ensure a minimum standard of reliability, BLS requires that at least 30 sample cases be the basis for publication of data below the State or area totals. As a result of these two requirements, minimum bases for publication have been developed for each State. Table B-1 lists the minimum necessary base for publication of data in each of the States, the District of Columbia, and the metropolitan areas and cities appearing in this report.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. The determining factor for publication is the size of either the denominator of the distribution or the unemployment rate. In tables showing labor force status, the size of the labor force of the particular group determines whether data for that group are published. In all other tables, the determining factor is the base or total of the distribution—which equals 100 percent. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

The sampling error tables (tables B-2 through B-17) can be used directly to develop 90-percent confidence intervals for sample estimates. They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate. (A sampling error equals 1.645 times one standard error.)

Table B-2 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 8,000, and a relative sampling error of 16 percent, while an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 12,000 and a relative sampling error of 12 percent.

The statement that unemployment in Alabama is between 42,000 and 58,000 in the first instance, and between 88,000 and 112,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges. Hence we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent confidence interval (2 chances out of 3), multiply the sampling error shown by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 8,000. At 68-percent confidence, the error would be about 4,800 (8,000 X 0.6 = 4,800). At 95-percent confidence, the error would be about 9,500 (8,000 X 1.19 = 9,520).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1979 to 1980 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$E_d = \sqrt{(E_1)^2 + (E_2)^2 - C}$$

where:
E_1 = the sampling error of one group or year
E_2 = the sampling error of another group or year
C = the covariance (or relationship) term between E_1 and E_2
E_d = the sampling error of the difference

The E_1 and the E_2 must be found in the appropriate *Geographic Profile* for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. Estimates for the "C" term for areas in this report are not available. (If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10 percent to 8 percent between 1979 and 1980 was significant. Assume that the labor force was about 100,000 in both years. Table B-8 in the 1979 *Geographic Profile* gives the error for a 10.0 percent unemployment rate as 1.11, and table B-6 in this year's *Geographic Profile* gives the error for an 8.0 percent unemployment rate as 1.07. Using the formula described above, the following would result.

$E_1 = 1.11$ $\qquad$ $E_2 = 1.07$

$(E_1)^2 + (E_2)^2 = 2.377$

$\sqrt{2.377} = 1.54$

Assuming a negligible "C" term, the error of the difference is about 1.5. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-2 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_S = [[(S - G) \quad (F - G)] \times (X - Y)] + Y$$

where:
- F = published size immediately above the size desired (200,000)
- G = published size immediately below the size desired (100,000)
- S = size desired (150,000)
- X = error of the F (16,000)
- Y = error of G (12,000)
- E_S = error of S (14,000)

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item.

The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from the Bureau of Labor Statistics on request.
